When exposed to light under the negative, the ferric oxalate becomes converted into ferrous oxalate in exact proportion to the amount of light it has received. The picture is developed by floating the exposed paper upon a solution of potassic oxalate, 150 grains to the ounce, at a temperature of from 170–180°. The ferrous salt formed by the action of the light reduces the platinum to a metallic state in the presence of the potassic oxalate solution, thus forming the image. A wash in dilute hydrochloric acid, 1 in 80, completes the process.

plăt'-ĭn-oŭs, *a.* [Eng. *platin(um)*; *-ous.*] Containing or consisting of platinum; of the nature of platinum.

plăt'-ĭn-ŭm, *s.* [Platina.]

Chem.: Symbol, Pt. Atomic weight, 197·4; sp. gr. = 21·6. A tetrad metallic element discovered first in America, and still largely obtained from that country; also found in the Ural chain, and in copper ore from the Alps. [Platinum-ore.] The ore is treated with nitromuriatic acid, which dissolves platinum and palladium, the solution is then treated with potassic chloride, yielding the double salt of platinum and potassium—the palladium being left in solution. By igniting with carbonate of potash, the platinum is reduced to the metallic state. It still contains traces of iridium, which gives it greater hardness and tenacity. Pure-forged platinum takes a high lustre, is nearly as white as silver, and very ductile and malleable. It resists the strongest heat of the forge-fire, but can be fused by the electric current; is the heaviest known substance excepting osmium and iridium, is unalterable in the air, dissolves slowly in nitromuriatic acid, but is not attacked by any single acid. Its properties render it extremely useful to the chemist for the construction of crucibles, evaporating dishes, and stills used in the concentration of oil of vitriol.

platinum are capable of taking up ammonia and forming amines, *e.g.*, diammonio-platinous, chloride = $(H_3N)_2Pt''Cl_2$, is obtained by neutralising a solution of platinous chloride in hydrochloric acid with carbonate of ammonia, heating to the boiling point, adding to it ammonia, and allowing to cool. It deposits as a yellow crystalline salt. Methylamine combines with platinous chloride in a similar way, forming the compound, $PtCl_2(CH_3N)_4$. $PtCl_2$, a chrome-green powder.

platinum-black, *s.*

Chem.: Platinum in a finely-divided state. Obtained when alcohol is carefully added to a solution of platinous chloride in hot concentrated potash. When purified and dried it resembles lamp-black, condenses gas in its pores like charcoal, and converts alcohol into acetic acid.

Chem.: Pt' B. Obtained as a silver-white fusible compound, when boron is heated with platinum foil before the blowpipe.

platinum-carbide, *s.*

Chem.: PtC (?). A compound obtained by calcining organic platinum salts at a moderate heat. Is slowly attacked by nitromuriatic acid.

platinum-chlorides, *s. pl.*

Chem.: Platinum forms two chlorides: (1) Platinous chloride, $PtCl_2$. Prepared by heating platinic chloride, by the aid of an oil bath, to 200°, until it becomes insoluble in water. It is a greenish-brown solid body, soluble in hydrochloric acid as dichloride, if protected from the air. It dissolves in caustic potash, and all the platinum is thrown down as platinum-black on the addition of alcohol. With metallic chlorides it forms double salts, most of which are highly crystalline. (2) Platinic chloride, $PtCl_4$. Obtained by dissolving platinum in nitromuriatic acid and evaporating over the water-bath. Hist. & Philos.: The philosophy of Plato, or rather that attributed to Plato, for though his writings exerted a marvellous influence over the minds of his successors, and, in a certain degree, over the early Christian Church, yet in those writings there is nothing like a connected system to be found. G. H. Lewes (*Hist. of Philos.* (ed. 1880), i. 220) says: "I come to the conclusion that he never systematized his thoughts, but allowed free play to scepticism, taking opposite sides in every debate, because he had no steady conviction to guide him; unsaying to-day what he had said yesterday, satisfied to show the weakness of an opponent." Nevertheless, he is of opinion that certain theoretical views, which frequently recur in the writings of Plato, in more or less modified form, may be loosely styled Platonic theories, though "they are sometimes disregarded, at others contradicted." These are (1) The theory of Ideas [IDEA]; (2) The doctrine of the Pre-existence and Immortality of the Soul; and (3) The subjection of the popular divinities to one Supreme God.

Pathol.: Inflammation of the pleura, going on to exudation, fluid effusion, absorption, and adhesion. A stitch in the side is complained of, the breathing becomes hurried and shallow, and, as the sero-fibrinous deposit becomes greater, intense dyspnœa sets in, with a short, dry, hacking cough. Pus occasionally forms in severe cases, leading to dangerous complications, for which aspiration may be required. Old adhesions also add to the danger, as well as lung consolidations. Mechanical fixing of the structures affected is an important element in the successful treatment of pleurisy, strapping with adherent plaister, opium to relieve pain, &c., blisters, diuretics, hot vapour baths, and good nourishment are also useful means, with quinine and cod liver oil in the convalescent stages, to promote recovery.

plī-ō-çēne, pleī-ō-çēne, *a.* [Gr. πλειων (*pleiōn*) = more, and καινος (*kainos*) = recent.]

Geol.: The epithet applied by Sir Charles Lyell to the most modern of the three periods into which he divided the Tertiary. Its distinguishing character is that the larger part of the fossil shells are of recent species. Lyell divides it into the Older and the Newer Pliocene. In the Older, the extinct species of shells form a large minority of the whole; in the Newer, the shells are almost all of living species. Deshayes and Lyell considered that the Older Pliocene had 35 per cent. and the Newer 90 to 95 per cent. of the shells of recent species. Etheridge makes the number 40 to 60 per cent. for the Older and 80 for the Newer Pliocene. Lyell's divisions (in reverse order) of the Pliocene are these:

Older Pliocene.—*British:* Red Crag of Suffolk; White, or Coralline Crag of Suffolk. *Foreign* Diestien and Antwerp Crag; Sub-Apennine Marls and Sands, and Pliocene of North America. Deposit at Pikermi, near Athens; strata at the Sivalik Hills.

Newer Pliocene.—*British:* Forest bed of Norfolk Cliffs; Norwich Crag. *Foreign:* Eastern base of Mt. Etna; Sicilian strata; Lacustrine strata of Upper Val d'Arno; German and French Pliocene.

pneu-mō-nĭ-ą, * **pneū-mŏn-ў,** *s.* [Gr. πνευμονία (*pneumonia*).] [Pneumo-.]

Pathol.: Inflammation of the lung, usually caused by exposure to cold or wet, a cold draught or chill after being over-heated, injury to the chest, irritation, or as a secondary affection in small-pox, typhoid or puerperal fever, and other low wasting diseases; it may also be caused by long continued congestion of the lung substance, particularly in heart disease, or in old and weak people who are bedridden from any cause. It appears as hypostatic pneumonia, and in some malarial districts it occasionally becomes epidemic. It commences with hyperæmia and œdema,

followed by fibrinous exudations in the interior of the air cells and capillary bronchi, undergoing many changes of the most serious character, such as abscess, purulent infiltration, gangrene, &c. The right lower lobe is the most frequent point of attack, bronchitis and pleuritic exudation are common accompaniments. Herpes is frequently observed on the face and lips on the third or fourth day; prostration, dry brown tongue, cracked lips, with viscid expectoration of a rusty-nail colour, and in the acute hepatization stage, red blood-tinged sputum, are the usual symptoms, with fine crepitation, like the rustling of a hair rubbed between the fingers. The true crepitant rhonchus is heard all over the affected part. Pneumonia terminates generally in resolution and recovery, but sometimes in death from collapse and exhaustion.

II. *Technically:*

1. *Pharm.*: Professor Christison divides poisons into three great classes: irritants, narcotics, and narcotico-acrids or narcotico-irritants. A fourth class is sometimes added, septics, consisting of animal poisons, such as the bites of rabid animals and venomous snakes, the stings of insects, and the poison generated by pestilential carbuncle, &c. An irritant poison produces violent pain and cramp in the stomach, nausea, vomiting, convulsions &c. A narcotic poison produces stupor, numbness, drowsiness, coldness, and stiffness of the extremities, cold fetid greasy perspiration, vertigo, weakened eyesight, delirium, paralysis of the lower extremities, &c.; a narcotico-acrid poison produces a certain combination of the symptoms attendant on both the former classes. The chief irritants are the acids and their bases, some alkalis and their salts, the metallic compounds, as arsenic, mercury; the vegetable acrids or irritants, as some Cucurbitaceæ, Euphorbiaceæ, Ranunculaceæ, &c.; animal irritants, as cantharides; mechanical irritants, as glass, &c; irritant gases, as chlorine, the vapour of nitrous acid, &c.; narcotic poisons, as opium, nightshade, prussic acid, &c.; narcotico-acrids, such as strychnine, *Cocculus indicus*, and poisonous mushrooms. Savages poison their arrows by the milky juice of various Euphorbias or of the manchineel, or by the juice of two species of Strychnos. Both in man and in the inferior animals there is often a curious correlation between the colour of the skin and hair and immunity from the action of certain vegetable poisons. Metallic poisons act upon vegetables nearly as they do upon animals, that is, they are absorbed into the different parts of a plant, destroying the structure. Vegetable poisons, especially those which destroy animals by action upon their nervous system, also cause the death of plants.

2. *Law:* By the Pharmacy Act, 31 & 32 Vict., c. 121, only qualified persons are allowed to sell poisons. In all cases the word "poison" and the name and address of the vendor must be upon the label. No poisoned seed, grains, or flesh must be exposed on land.

It is quite white when young, changing to a creamy tint in maturity. Unlike most of its congeners, it is carnivorous, attacks by biting, not by hugging, and only the pregnant females hibernate. ¶ (1) *Polarization of Light:*

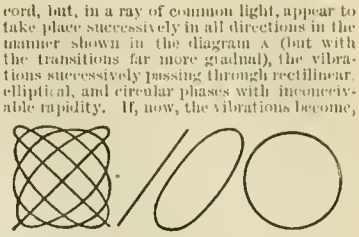
Optics: A state into which the ethereal undulations which cause the sensation of light are brought under certain conditions. These undulations are perpendicular to the line of transmission of the wave, as in a stretched cord, but, in a ray of common light, appear to take place successively in all directions in the manner shown in the diagram A (but with the transitions far more gradual), the vibrations successively passing through rectilinear, elliptical, and circular phases with inconceivable rapidity. If, now, the vibrations become,



A B C D

or are rendered, stable in any one form of orbit, the light is in the condition known as polarised, and the state is one of plane, elliptical, or circular polarization, according as the orbit resembles B, C, or D. The most familiar and simple form is that of plane polarization. This may be produced in various ways, the piece of apparatus producing such modifications being called a Polarizer. When produced, however, the effects can only be perceived by examining them through another piece of apparatus which, used alone, would polarize the light, but when used to examine light already polarized, is called the Analyser. The two in combination, with the necessary adjustments, form a Polariscope, of which there are many forms.

(*a*) *Plane polarization:* When a ray of common light passes through a crystal (not of the cubic system), the atoms being so arranged that the elasticity (or other properties affecting motions of the ether within the crystal) are different in different directions, the ether motions are at once resolved into that of the greatest and the least elasticity at right angles to the path of the ray, so dividing the ray of common light into two "plane polarized" rays, polarized in planes at right angles to each other. One of these rays being easily eliminated by total reflection in the Nicol prism (q.v.), two such prisms form a convenient polariscope. The ray, after passing through the first prism, appears just like common light, only of half the original brilliancy; but on looking at it through the second Nicol, on turning the latter round, we find two positions in which the light from the first Nicol gets through the second unaltered; and two positions at right angles to the former in which it is absolutely stopped, and the second prism, though clear as glass, is absolutely opaque to it. The beam of light appears thus to have acquired sides, and to behave differently according to the relation these sides bear to the position of the prism. Such is the fundamental nature and phenomenon of Polarized Light. Light is also polarized by reflection from polished transparent surfaces, when incident at such an angle that the reflected and refracted rays make a right angle. In glass, this angle is about 56°. An exactly equal quantity of the incident light which is transmitted through the glass, is polarized in a plane at right angles to the former. At other angles the effect is partial. The scattered light of the sky is always more or less polarized, as is all light reflected from small particles in air or water, if the particles are small enough; the polarizing angle for such particles is, as might be expected, 45°.

(*b*) *Chromatic polarization:* Let the perpendicular vibrations from a Nicol prism encounter in their path a crystalline film of selenite or mica, whose planes of greatest and least elasticity are arranged diagonally. The perpendicular vibrations are again "resolved" into two sets, one of which is retarded behind the other owing to the difference in the two elasticities. The analyser "resolves" each of these again, bringing half of each set back into one plane. The two sets of waves are then in a position to exercise interference, and the consequence is that, if the plate or film is of suitable thickness, the most gorgeous colours are presented. It is the same with every substance having different elasticities in different directions, and as all "structure" presents such differences, polarized light becomes the most powerful weapon of the biologist, revealing structure where ordinary light will not do so.

(*c*) *Circular polarization:* If two rectangular, equal impulses are given to a pendulum, or to a stretched cord, one of them a quarter-vibration later than the other, the two are compounded into a single circular orbit. Therefore, if a beam of plane-polarized light

possess, as in the last paragraph, through a film of mica of such a thickness that one of the two diagonally vibrating sets of waves shall be retarded, whilst in the film one quarter vibration behind the other, the two are compounded on emergence into one beam of circularly polarized light. At approximate thicknesses, the light is elliptically polarized. Circularly polarized light is never stopped by the analyser, but differs from common light in producing polarized effects. The most important of these is

(d) *Rotatory polarization:* Vary the former experiment by passing the light from the polarizing Nicol, with its vibrations in a vertical plane, through a plate of selenite or mica which gives blue colour; the vibrations are then in the two diagonals. Let this light now traverse a "quarter-wave" mica film, with its polarizing planes perpendicular and horizontal. Each set of rays from the first plate becomes circularly polarized, but the two in opposite directions, the circular movements thus opposing each other. Whenever two circular motions thus meet, as in two circular pendulums clashing, the tangential motion is destroyed, and the pendulums would both fall back together through the centre of the former orbit. It is so in this case; but as one set of rays has been retarded in the plates more than the other, the swing of the ether atoms is no longer in the original plane of vibration. Let that plane be A, B; instead of the two circular waves meeting at A again, as they would if both circular motions were equally rapid, the meeting-point will be somewhere on one side or other of it, as at M. There the right-handed ray will meet the left-handed ray, the tangential motions RM, LM, will be destroyed, and the radial forces unite in the plane-polarized swing-orbit M P, passing through the centre C. If, therefore, light of one wave-length or colour be employed, instead of the analyser having to be turned across A B to extinguish it, it must now be turned across M P—in other words, the original plane of polarization has been rotated. If white light be employed, the many various wave-lengths will obviously meet at different points, and hence rotation of the analyser will give in succession more or less of the colours of the spectrum. If the quarter-wave film is cut in half, and its position reversed in one half, the transition of colours will occur in opposite orders in the two halves. Rotatory polarization is of the greatest practical importance. There are many crystals, plates of which, when cut in proper directions, produce naturally all the phenomena of the double-plate described above. Many fluids, such as oil of lemons, turpentine, and solution of cane sugar, also show the same phenomena very strongly, and in their case it is remarkably connected with the presence in the molecule of what chemists call "asymmetrical atoms." In solutions, as of sugar, the amount of rotation is proportionate to the quantity of sugar in solution in a given column of fluid, hence the "estimation" of crystallizable sugar, whenever accuracy is required, is now always made by the polariscope. Faraday discovered, in 1845, that the property of rotatory polarization was conferred upon any transparent body when the axis of the ray employed was made the axis of a galvanic solenoid or strong magnetic field. [Polarized-rings.]

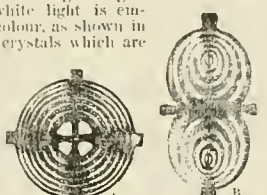
polarized rings, *s. pl.*

Optics: Imagine a crystal symmetrical around a single axis, like a section of the trunk of a tree, with the elasticity greatest or least in the direction of the axis, and symmetrically alike all round the circumference. If we cut a plate in the way of a plank, it will behave like the films already spoken of. But if a slice be cut across the trunk at right angles it must be different, when a ray of light passes through in the direction of the axis. The other vibrations are at right angles to the path of the ray (now the same as the axis), but in all these directions the elasticity is equal, consequently a beam of common light will not be doubly-refracted, nor a beam of plane-polarized light further resolved, in passing along the axis. This is borne out by cutting a plate of calcite at right angles to its axis. But if the ray passes through such a plate obliquely, double refractions and interference will come into action, and we shall perceive colour. Imagine now a conical, or strongly convergent pencil of plane-polarized light traversing the plate, and the analyser turned so as to extinguish the light passing the polarising Nicol. The centre of the plate, where the beam is truly axial, will still appear dark. But, as the light becomes more and more oblique, the vibrations will be resolved into some plane passing through the axis, and planes at right angles to these, or tangential planes. In perpendicular and horizontal planes, these will cause no further resolution of the vibrations, and there will therefore be a black cross when the analyser is crossed; but in all other planes, the more and more oblique light must cause successive rings of light and darkness, or, when white light is employed, of colour, as shown in fig. A. In crystals which are not perfectly symmetrical about one axis, the ideal structure may be compared to that of a tree-trunk of an oval section.



POLARIZED RINGS.

Here, a plank would still give two polarizing planes, as in a film of selenite; but a transverse section would also show two rectangular elasticities. In such a case, analysis proves that there must be two lines or axes inclined to each other, in which there can be no double refraction, and that the fringes of colour must take the general shape of lemniscates, as shown in fig. B. In many crystals the properties are quite different for light of different wave-lengths, and in some, the plane of the axes is at right angles for one end of the spectrum to what it is for the other. The relation of the elasticities may also be profoundly changed by heating the crystal, so that the intermediate one becomes greatest or least; in such cases, as in heating selenite, the double rings of B gradually merge into one as at A, and then the two rings spread out again in a direction at right angles to the former. Generally, it may be said that cubic crystals possess no double refraction; that crystals symmetrical round one axis are uniaxial, doubly-refracting, and exhibit circular rings; and that other crystals are bi-axial, and exhibit double rings. All these phenomena are of the greatest importance in the study of rocks, and the fragments of crystals embedded in them.

One points to the north and is called the North Pole, the other to the south and is called the South Pole. Similar poles repel, dissimilar poles attract each other. Sometimes there are intermediate poles, called "consequent poles." When the earth is viewed as a magnet, the spots where the magnetic needle stands vertical are called the "magnetic poles." In 1830 Sir James Ross found that the magnetic north pole was in 76° N. and 96° 43′ W. At the same time the position of the magnetic south pole was calculated to be in 75½° S. and 154° E. But it does not always retain the same place. This is shown by what is called the declination or variation of the magnetic needle, *i.e.*, the angle which it makes with the geographical meridian. At London, in 1580, this was 11° 36′ E., and in 1893, 17° 11′ W.

¶ The unit magnetic *pole*, or the *pole* of unit strength, is that which repels an equal pole at unit distance with unit force. In the C. G. It is at present less than a degree and a half from the true pole, and by A.D. 2095, through the precession of the equinoxes, it will be under half a degree. [Precession.] Even now the circle it describes is too small to be discernible by the ordinary eye. The pole-star is really a double star of yellow hue, but while the larger or visible one is between the second and third magnitude, its companion is only of the ninth, and therefore a telescopic star. There is no corresponding star in the southern hemisphere. The pole-star is a convenient one for observing to determine the latitude and also the azimuthal error of any transit-instrument.

1. *Comm.:* A document containing a promise to pay a certain sum of money on the occurrence of some event. In return for this promise a sum of money is paid down, called the premium (q.v.). By far the largest part of insurance business is applied to disasters at sea; to destruction of property by fire; to making provision for heirs and successors in case of death, and to loss of time and expense through accident. The practice of insurance has also been extended to making provision against loss of crops from bad weather, against destruction of glass from storms and accidents, &c. In every case a form is filled up containing a promise to pay a certain sum in the event of the happening of the specified contingency, and this document is always called the policy. Although an insurance policy is a contract, it is only signed by one party, the insurer, who for that reason is called the underwriter, and forms, therefore, what is called in law an unilateral contract. Marine policies are of two kinds: (1) Valued policy, one in which the goods or property insured are at a specified value; (2) Open policy, one in which the value of the goods or property is not mentioned. [ASSURANCE, INSURANCE.]

political economy, *s.* According to John Stuart Mill, the science which investigates "the nature of wealth and the laws of its production and distribution, including, directly or remotely, the operation of all the causes by which the condition of mankind, or of any society of human beings, in respect to this universal object of human desire, is made prosperous or the reverse." (*Polit. Econ., Pref. Remarks.*) Inquiries on these points must have existed from the earliest times in every nation, but political economy as a science

very [illegible]dern. Crude views on the subject arose in the middle ages in the free Italian cities and the Hanseatic towns, where apparently originated some of the fallacies still current among sections of the British populace. Sir Walter Raleigh (1595), Sir William Petty (1677), and Sir Dudley North (1691) wrote on the subject with enlightenment for their age. François Quesnay, in France (1758), founded the school of the economists which held that the soil is the source of all wealth. [PHYSIOCRAT.] Adam Smith (1723–1790) had made political economy a portion of his lectures whilst Professor in Glasgow University from 1751 to 1764. Visiting Paris in that year, he became acquainted with Quesnay and the leading economists, but the principles of his great work, the *Wealth of Nations*, published after ten years' retirement, in 1776, were, in the main, thought out independently. It was immediately and extensively popular, but did not begin to tell powerfully on the British Parliament till seventy years afterwards, and has not gained proper influence over colonial and foreign legislatures even yet. Since Adam Smith's time, no work on the subject has appeared more original or influential than the *Principles of Political Economy*, by John Stuart Mill. In this and his other productions advocating liberty, he yet considers that public opinion and, if need be, even law should be directed against the increase of population when there is no hope of comfortable, or at least of decent, maintenance, and that the unearned increment of land should be appropriated by the state. This latter view the late Prof. Fawcett, another eminent political economist strongly controverted.

Anthrop.: The marriage by one man of several wives at the same time. (See extract.)

"Plurality of wives has everywhere tended to become a more or less definite class distinction . . . Joining which facts with those furnished to us by the Hebrews, whose judges and kings—Gideon, David, and Solomon—had their greatness so shown; and with those furnished us by extant Eastern peoples, whose potentates, primary and secondary, are thus distinguished: we may see that the establishment and maintenance of *polygyny* has been largely due to the honour accorded to it, originally as a mark of strength and bravery, and afterwards as a mark of social status."—*H. pŏl-ĭ-thē-ĭsm, *s.* [Pref. *poly-*; Gr. θεός (*theos*) = God, and suff. *-ism*; Fr. *polythéisme.*]

Compar. Relig.: The worship of many gods. It is not necessarily the same as idolatry, for gods may be adored without any image of them being made. In Sir John Lubbock's classification of religious beliefs, Fetishism and Totemism are polytheistic; the next stage in the ascending order, Anthropomorphism, may or may not be so. No mention is made in Scripture of Polytheism before the flood. It existed among the ancestors of Abraham in Ur of the Chaldees (Joshua xxiv. 2). The first commandment is levelled against it (Exod. xx. 3, Deut. v. 7). It was common at the time among the Canaanites (Deut. vi. 14, vii. 4, &c.). At many periods the Jews, high and low, lapsed into it (1 Kings xix. 2; 2 Kings xvii. 16, 17; Ezek. viii. 3-18). Though some of the Greek and Roman philosophers may have risen above polytheism to conceive the unity of God, the masses of the people were polytheistic, as is the case with the ethnic nations to-day, though in some cases, as in that of India, pantheism underlies polytheism, and some apparent polytheists really believe all nature to be one God.

The rule, which was exceptionally severe, was mitigated by Pope Urban IV. in 1264, and the order then separated into two branches: the Urbanists, who followed the mitigated, and the Clarisses, who adhered to the original, rule. In 1436 St. Colette brought back a number of houses in France and Flanders to the observance of the rule of St. Francis. The Poor Clares have given their name to a district of London—the Minories—the site of the first house of the order founded in England (1263). They have now houses in this country and in Ireland.

* The Act 23 Edward III., passed in 1349, enacted that no person should give alms to a beggar able to work. The support of the poor was undertaken by the church. By 27 Henry VIII., passed in 1535, and necessitated by the dissolution of the monasteries, a compulsory poor law was established. The 43 Elizabeth c. 2, passed in 1601, contained the germ of the present poor law. It directed parishes to relieve the blind, the lame, and the impotent, and appointed overseers of the poor. It was modified in 1662. In 1722 the workhouse system began. Between 1812 and 1832 the pauperism of England was a frightful burden, threatening ruin to the country, which was averted by the Poor Law Amendment Act, 4 & 5 William IV., c. 76, passed in August, 1834. It appointed a Central Board, divided the country into Unions, requiring workhouses to be built in each, and the paupers to reside in them and submit to a labour test, in place of obtaining outdoor relief, carrying with it little or no inconveniences. Prior to 1834 one person in twelve was a pauper, by 1849 the perceutage was 6·2, by 1867, it had fallen to 4. Outdoor relief is still given, though on a more limited scale than prior to 1834, and some modifications of the Act have taken place, but its essential features still remain. In 1838 a poor law was passed for Ireland. To a less extent than in England has it tolerated outdoor relief. Prior to 1845 the care of the poor in Scotland was undertaken mainly by the Established Church of that country. The Disruption of 1843 so crippled it that a poor law became necessary, and was passed in 1845. It is essentially the same as that in England, but pauper children are not kept in the workhouse, or educated in workhouse schools, but are boarded out. [Boarding-out.]

5. The Bullfinch (q.v.).

¶ The term Papa, or Papas (father), has always been given by the Greek Church to presbyters, like the term Father now applied to a Roman priest. In the early centuries the bishops received the same title till, in a council held at Rome in 1076, at the instance of Gregory VII. (Hildebrand), it was limited to the Bishop of Rome. Holding that office, being also Metropolitan of Rome and primate, and claiming to be the earthly head of the Church universal, it is in the last-named capacity that the term Pope is held to be specially applicable. [Conclave.] It has been a matter of controversy among Roman Catholics whether the authority of the Pope was above or below that of the General Council. That of Pisa (1409), claiming to be a General Council, deposed two rival popes, and appointed a third; but the two former repudiated the authority of the Council, and exercised their functions as before. The Council of Constance (1414–1418) also deposed two rival popes and elected one. In 751, Pope Zachary being consulted as to the right of the warlike French to depose their incompetent king, Childeric, and raise Pepin, the able Mayor of the Palace, to the sovereignty, sanctioned the proceeding. Pepin, in return, became his friend, and handed over to the Church the Exarchate and the Pentapolis. Charlemagne, in 774, confirmed and enlarged the gift. In 1076 or 1077 the Princess Matilda, daughter of Boniface, Duke of Tuscany, made the Holy See heir to her extensive possessions. Thus arose "the States of the Church" which figured on the map of Europe as an independent sovereignty till Sept. 20, 1870, when the troops of Victor Emmanuel, King of Italy, entered Rome, nominally in the interests of order, and took possession of the place for the Italian Kingdom. On July 2 and 3, 1871, the seat of government was removed thither. It still continues the metropolis. No interference took place with the Pope's purely spiritual authority, but much with his temporal possessions and revenues. [Infallibility.]

Gradually evidence arose that the whole story was a fabrication, and that the people who had been capitally punished were all innocent. On May 8, 1685, Oates, who had received a pension of £2,000 for his revelations, was convicted of perjury, heavily fined, pilloried, and publicly flogged. Males, stamens four to thirty; females, stigmas two- to four-cleft; capsule two-celled, loculicidal. Known species eighteen; from the north temperate zone. Two, *Populus alba*, the Great White Poplar or Abele, and *P. tremula*, the Trembling Poplar or Aspen, are indigenous. *P. nigra*, the Black Poplar, is only naturalised. The first is a large tree with downy, but not viscous buds, roundish, cordate, lobed-toothed leaves, glabrous above, downy and very white beneath, ultimately becoming glabrous on both sides. It grows in moist places and mountain woods. The timber is white, soft, and used only for coarse work. The bark is said to be useful in strangury. Sir Joseph Hooker considers *P. canescens*, the Gray Poplar, to be only a sub-species of it. For the second species, see Aspen. *P. nigra* has viscid buds, leaves rhombic, deltoid, or suborbicular, finely crenato-serrate; at length becoming glabrous. It grows in moist places, on river banks, &c. The wood is light, and not very valuable. It is used for carving, or burnt for charcoal, and the bark employed for tannin. *P. monilifera* is the Black Italian Poplar, *P. fastigiata*, the Lombardy Poplar, and *P. canadensis*, the Canadian Poplar. The buds of *P. nigra*, the Himalayan *P. balsamifera*, *P. caudicans*, &c., are besmeared in winter with a resinous, balsamic, bitter, aromatic exudation, called Tacamahac, considered to be diuretic, and antiscorbutic. The bark of *P. euphratica* is given in India as a vermifuge.

A. *As substantive:*

Art: A fictile material intermediate between glass and pottery, being formed of two substances, fusible and infusible, the latter enabling it to withstand the heat necessary to vitrify the former, thus producing its peculiar semi-translucency. The infusible material is alumina, called kaolin; the fusible substance is felspar, and is called pe-tun-tse, both Chinese terms. There are two kinds, hard and soft (*pâte dure* and *pâte tendre*); the hard body has more alumina and less silex and lime. Oriental porcelain is of two kinds, ancient and modern; the latter class includes imitations and reproductions. The manufacture began in China between 185 B.C. and 87 A.D., and reached its perfection during the Ming dynasty (1368–1644). The rarest Chinese wares are of the Tsin dynasty (265–419 A.D.), the Soui (581–618), and the Thang (618–907)—forms virtually extinct except as copies. The Tcheou porcelain (954–959) is so valued that fragments are worn as personal ornaments. Ware of the Song dynasty (960–1279) is also highly prized. Porcelain came by trade into Persia and Egypt, and was known in Syria in the twelfth century. Marco Polo in the thirteenth century described the Chinese method of manufacture from personal observation. First imported into Europe by the Portuguese in 1520. In Japan the porcelain manufacture began before 27 B.C., with a whiter body and more brilliant glaze than that of the Chinese. It is doubtful if it was ever made in Persia. In Europe, Boettcher, a Saxon chemist, found kaolin while seeking the philosopher's stone; and Augustus II., elector of Saxony and king of Poland, established and placed under his control the famous Meissen factory at the castle of Albrechtsburg in 1710; forty years later 700 men were employed. In Vienna, Stolzel, who escaped from Meissen in 1720, began the Austrian factory, which in 1785 employed 500 men; another was established in Berlin by Frederick the Great. During the eighteenth century, works were begun in Russia, Holland, Denmark, Spain, Portugal, Switzerland, and Italy. In France, soft porcelain was made at St. Cloud in 1695. Comte de Brancas-Lauraguan, in 1758, found kaolin near Alençon, and porcelain was made at St. Yrieux, near Limoges. The Sèvres manufactory was first established at Vincennes in 1740, and moved to Sèvres in 1756. In France, the manufacture of soft porcelain extends from 1695 to 1770, after which date the hard body of Sèvres takes its place. In England, William Cookworthy, a chemist of Plymouth, found kaolin at Tregonning, near Helstone, in Cornwall, and his patent of 1768 was worked at Plymouth for two or three years, when the works were removed to Bristol. At Cheisea

and how soft porcelain had been made. These two were transferred to Derby in 1770 and 1770. Bristol had a soft body works in 1748. Its best period was from 1774 to 1778. Worcester porcelain dates from 1751, its best period ended with 1783. Other sites for the manufacture are found at Swinton, Yorkshire, where Rockingham ware was made, Broseley and Coalbrookdale in Salop, Nantgarw near Cardiff, Swansea, Lowestoft, and other places.

1. *Zool.*: The popular name for any individual of the genus Hystrix or the family Hystricidæ (divided into two groups, Hystricina and Synetherina, or two sub-families, Hystricinæ and Sphingurinæ, the first group or sub-family containing the Old World, or True, Porcupines, and the second those peculiar to the New). The Common Porcupine (*Hystrix cristata*) may be taken as a type of the True Porcupine. It occurs in the south of Europe, and the north and west of Africa, is about twenty-eight inches long, exclusive of the tail, about four inches. It is somewhat heavily built, with obtuse head and short limbs. The head, fore quarters, and under surface are clothed with short spines intermixed with hairs, crest on head and neck, hind quarters covered with long sharp spines, ringed with black and white, and erectile at will. They are but loosely attached to the skin and readily fall out, a circumstance which probably gave rise to the belief that the animal was able to project them at an enemy. It is a purely vegetable feeder, and lives in holes in the rock, and burrows in the ground. The Hairy-nosed Porcupine is *H. leucura* (or *hirsutirostris*) from Syria, Asia Minor, and India; and the Brush-tailed Porcupines belong to the genus Atherura. They have long tails, tipped with peculiar flattened spines. [Synetherina, Trichys, Tree-porcupine.]

Some, however, include varieties in which the orthoclase constituent is more or less replaced by oligoclase. Many porphyritic dolerites have been also included under this name. By the presence of hornblende it often approaches the composition of a syenite (q.v.), with which it is frequently associated.

It is still used by some petrologists as a generic name for all rocks consisting of a felsitic base, with felspar crystals. Rocks of varied mineralogical composition, origin, and of various colours, having however been included under this name, English and most American petrologists use it in its adjectival form only. Thus, any rock in which crystals of felspar are individually developed, irrespective of the mineralogical composition of the whole, is said to be porphyritic.

Zool.: *Phocæna communis*, and any species of the genus; loosely applied by sailors to any of the smaller cetaceans. The common porpoise, when full-grown, attains a length of about five feet. The head is rounded in front, and the snout is not produced into a beak. The external surface is shining and hairless, dark gray or black on the upper parts, under pure white. It is gregarious in habit, and is often seen in small herds, frequenting the coasts rather than the open seas. It often ascends rivers, and has been met with in the Thames, near Richmond, and in the Seine, at Neuilly. It is found on the coasts of Scandinavia, and ranges as far north as Baffin's Bay and as far west as the coast of the United States. Southwards its range is limited, and it is unknown in the Mediterranean. It feeds on fish, and was formerly esteemed as an article of food. Its only commercial value now is derived from the oil obtained from its blubber. Its skin is sometimes used for leather and boot-laces, but "porpoise-hides" are ordinarily obtained from *Delphinapterus leucas*, the Beluga, or White Whale.

* 3. A fixed or established place on a line of road where horses were kept for travelling; a stage, a station, a posting-house.

¶ Posts seem to have been first established for the conveyance of government messengers or private travellers rather than of letters. The ancient system extensively existed in the provincial parts of India till the introduction of railways narrowed the sphere of its operations. An important traveller, wishing to go to Europe, wrote to the European authorities of the district, who sent out instructions to the heads of the several villages to have relays of bullocks or palanquin bearers at fixed stages along the intended line of route. If he arrived too late he had demurrage to pay to all who lost time waiting for him. Till recently the same system, but with post-horses, extensively prevailed in the West. In Europe it was generally a government monopoly; in England it was conducted (and more effectively) by private enterprise. [6.]

¶ Cyrus, the founder of the Persian empire, is credited with the first use of posts for letters. Probably the earliest were government despatches; then private letters would be taken surreptitiously, and finally arrangements would be made for doing so as a government monopoly. Despatches sent by Ahasuerus (Xerxes ?) throughout the Persian empire are mentioned in Esther i. 22; iii. 12-15; viii. 5-10, 13, 14; ix. 20, 30. They were by posts, i.e., men riding on mules and camels (viii. 14). Augustus Cæsar had similar posts in Rome. Charlemagne seems to have introduced them into France. [Post-office.]

2. A department of the government having charge of the conveyance of the public mails.

¶ James I., in 1619, established a post-office, and Charles I., in 1635, a letter-office for England and Scotland, but these extended only to the principal roads, and the times of carriage were uncertain. In the latter year the charge for a single letter under eighty miles was 2d., under 140 it was 4d., above 140 it was 6d., on the borders, and in Scotland 8d. The parliament of 1643 framed the Act which provided for the weekly conveyance of letters into all parts of the kingdom, and a regular post-office was erected closely resembling that now existing, and with rates of postage which continued till the days of Queen Anne. In 1660 the members of the House of Commons claimed that their letters should be carried free. The loss to the revenue through this franking system was £23,600 in 1715, and £170,700 in 1763. In 1683 a metropolitan penny post was established. In 1794 this post was improved, but the price of the postage was doubled. On Sept. 22, 1829, the seat of the post-office was transferred from Lombard-street to St. Martin-le-Grand. In 1839 Rowland Hill brought forward his scheme for a penny postage throughout the United Kingdom. It came into operation on Jan. 10, 1840, on the scale of a penny for every letter below half an ounce in weight. In 1839 the number of letters carried was 75,907,572. The first year of the reduced tariff it rose to 168,768,344, and has since continued to advance year by year, proportionately quicker than the population. A money-order office, which had languished since its origin in 1793, was developed in 1840. Street letter-boxes were first erected in 1855. On June 5 of that year, a Treasury warrant was issued establishing a post for books, pamphlets, &c. Post-office savings banks were added in 1861. In 1869 the post-office was empowered to purchase the electric telegraphs, and began public telegraph business on Feb. 5, 1869. In 1870 the foundation-stone of a new General London Post-office was laid; it was opened in 1873. Halfpenny post-cards, and the uniform postage of ½d., for newspapers, began Oct. 1, 1870. On October 5, 1871, the weight for 1d. was advanced to an ounce, a halfpenny being fixed for each additional ounce. In 1885 the parcels post with prepayment began. On October 1 of that year the system of six-penny telegrams first came into operation. On June 22, 1897, the weight for letters for 1d. was advanced to four ounces; and on Christmas Day, 1898, the (partial) Imperial postage of 1d. per half-ounce came into operation.

Tripotassamide, or nitride of potassium, K_3N, is obtained when monopotassamide is heated in a close vessel. It is a greenish-black substance, taking fire spontaneously when exposed to the air. In contact with water it is decomposed, yielding ammonia and potassium hydrate.

pŏ-tăs'-si-ŭm, *s.* [Latinised from *potash* (q.v.).]

Chem.: Symbol, K; atomic weight, 39. A monad metallic element, discovered by Davy in 1807, and very widely diffused through the vegetable, mineral, and animal kingdoms. It usually exists in combination with inorganic and organic acids, and, when its organic salts are burnt, they are resolved into carbonate, from which all the other salts of potassium can be prepared. It may be obtained by electrolysis, but is now produced in large quantity by distilling in an iron retort an intimate mixture of charcoal and carbonate of potassium, a condition readily obtained by igniting crude tartar in a covered crucible. It is a bluish-white metal; sp. gr. ·865, being the lightest of all the metals except lithium. At 0° it is brittle and crystalline; soft at 15°, and may be easily cut with a knife; fluid at 62·5°, and at a red heat distils, yielding a beautiful green vapour. Thrown upon water, the metal decomposes it with great violence, forming hydrate of potassium, whilst the escaping hydrogen takes fire, burning with a rose-red colour. It can only be preserved in the metallic state by immersing it in rock oil.

¶ Potassium-chloride = *Sylvite*; Potassium-nitrate = *Nitre*; Potassium-sulphate = *Aphthitalite* and *Misenite*.

potassium-alloys, *s. pl.*

Chem.: Alloys formed by fusing other metals with potassium. The arsenide and antimonide (the only important forms), heated with the alcoholic iodides, yield the arsenide, &c., of the alcohol radicals.

potassium-bromide, *s.*

Chem.: KBr. Formed by the action of bromine on potassium, or by neutralising hydrobromic acid with potash. It crystallizes in brilliant cubes, having a sharp taste; sp. gr. 2·69; is more readily soluble in hot than in cold water, and is slightly soluble in alcohol. By oxidising agents it is converted into bromate.

potassium-carboxide, *s.*

Chem.: $K_2C_2O_2$. A highly explosive compound formed sometimes in the manufacture of potassium, and when potassium is heated to 80° in presence of carbonic oxide. It is first of a gray colour, and then becomes dark red. The gray compound has the composition K_2CO; the red body can be preserved under mineral naphtha. In contact with water it explodes with great violence.

potassium-chloride, *s.*

Chem.: KCl. Occurs native as sylvite, and is formed when potassium is burned in chlorine, and when potash or carbonate of potash is neutralized with aqueous hydrochloric acid. It crystallizes mostly in cubes, rarely in octahedrons; sp. gr. 1·95; tastes like common salt, melts at a low red heat, and at a higher temperature volatilizes unchanged. It is very soluble in water, one part of the salt dissolving in 2·85 parts of water at 15·5°; is slightly soluble in strong alcohol, but wood spirit dissolves it more readily. It forms crystallizable double salts with most of the metallic chlorides.

potassium-ethyl, *s.*

Chem.: C_2H_5K. Not known in the separate state, but in combination with zinc-ethyl by treating that compound with potassium.

potassium-hydrate, *s.*

Chem.: KHO. Potash. Potassa. Caustic potash. Produced by dissolving protoxide of potassium in water, but generally prepared by adding two parts of quicklime, slaked with water, to a solution of one part of carbonate of potassium in twelve parts of water, and boiling the mixture for some time. After standing, the clear liquid is siphoned off and evaporated in iron or silver basins. To remove several of the impurities it is subsequently treated with alcohol. After fusion it is a white, hard, brittle substance, sp. gr. 2·1, melts below redness to a clear liquid, volatilizes at a red heat, dissolves in half its weight of water, and in nearly the same quantity of alcohol. It has an acrid taste, is a powerful caustic, decomposes most metallic salts, and at a high temperature acts with great energy on nearly all substances.

potassium-iodide, *s.*

Chem.: KI. Obtained by direct union of iodine and potassium, and by neutralizing hydriodic acid with potash. It crystallizes in cubes, which are sometimes transparent, often opaque; sp. gr. 2·90. It has a sharp taste, melts below a red heat, and at a moderate red heat volatilizes without change; is soluble in ·7 part of water at 16°, and in 5·5 parts alcohol at 12·5°. A solution of this salt dissolves free iodine, forming a dark-brown solution. It is much used in medicine.

potassium-oxides, *s. pl.*

Chem.: Potassium forms three oxides: (1) Protoxide, K_2O, formed when potassium is exposed to dry air at ordinary temperatures, is white, very deliquescent and caustic, and unites with water so energetically as to produce incandescence; (2) Dioxide, K_2O_2, is formed at a certain stage in the preparation of the tetroxide, and when the latter substance is decomposed with water; (3) Tetroxide, K_2O_4, is produced when potassium is burnt in dry air or oxygen. It is a chrome yellow powder which is reduced to protoxide when heated in an atmosphere of nitrogen, and to the dioxide when dissolved in water, oxygen in each case being evolved.

potassium-sulphides, *s. pl.*

Chem.: Potassium unites with sulphur in five different proportions: K_2S, protosulphide, obtained, but in a state of doubtful purity, by igniting sulphate of potassium in a covered crucible with finely divided carbon. It has a reddish-yellow colour, is deliquescent and caustic. K_2S_2, disulphide, formed by exposing the sulphydrate to the air, is obtained as an orange-coloured fusible substance. K_2S_3, trisulphide, obtained by passing the vapour of carbonic disulphide over ignited potassium carbonate. K_2S_4, tetrasulphide, formed by reducing sulphate of potassium by means of the vapour of carbonic disulphide. K_2S_5, pentasulphide, obtained from any of the above sulphides by boiling them with excess of sulphur until fully saturated. All the sulphides have an alkaline reaction and smell of sulphydric acid.

Bot., Hort., Agric., &c.: Solanum tuberosum, a well-known plant, the tubers (dilated branches) of which are eaten. It is a native of Chili and Peru. Some think that it was first brought to Spain from the mountains near Quito early in the sixteenth century. Thence it spread to Italy and Austria. Sir Walter Raleigh is supposed to have brought it to England in July, 1586, having obtained it from the Virginian colonists whom he had taken out in 1584. Gerarde, in his *Herbale*, figured it in 1597 as "the potatoe of Virginia," whence he said he had obtained its roots. Sir Walter Raleigh cultivated potatoes on his estate of Youghal, near Cork. For the next century and a half they were regarded as garden plants only. In Scotland they were not cultivated as a field crop till 1732. They gradually made way to the important position which they now occupy in British agriculture. Many varieties are grown, differing in earliness, form, size, colour, &c. They are sometimes preserved through the winter in pits dug in the ground, and lined with straw. A raw potato scraped is a good application to burns and scalds. [POTATO-STARCH.]

potato-disease, *s.*

Veg. Pathol.: A disease or murrain produced by a fungus, *Peronospora infestans*. It generally first attacks the leaves and stems of the plant, forming brown spots upon them in July and August. By this time, the fungus which first penetrated the tissue of the leaf, has thrust forth through the stomates its conidia-bearing filaments. The leaves soon afterwards die. Next the tubers are attacked and decay, either in a moist manner, attended by a disagreeable odour, or by a drying up of the tissue. Sometimes the term potato-disease is limited to the first of these kinds of decay, but they are closely akin, the one form passing into the other. Possibly an excess of rain in particular seasons created a predisposition to the attacks of the fungus. Too strong manuring, and the cutting up of seed potatoes have also been suggested as predisposing causes. The potato-disease first appeared in America. In 1845–1847 it caused the failure of the potato crop in Ireland, producing famine. [FAMINE.] It has never since completely disappeared, and in 1860 was nearly as formidable in some places as on its first appearance. When it is prevalent, the potatoes should be powdered with flowers of sulphur before being planted. They should be put early in the ground, and the haulm removed when the disease manifests itself.

They appear to have been formed in the dolomitic conglomerates. According to Green, this name has also been applied to certain hollow limestone pebbles, which have been converted into dolomite, their interiors being lined with crystals of the same substance.

B. to be forewarned (to appear and answer the contempt with which he is charged) (16 Richard II., c. 5). The original offence against which the Statute of Præmunire was directed was that of asserting the jurisdiction of the pope in England, and denying that of the king. But by subsequent statutes the penalties of præmunire have been extended to many other offences of a miscellaneous kind. Thus by 25 Henry VIII., c. 20, refusal to elect, confirm, or consecrate a prelate named by the king, incurs these penalties. They are also incurred by any officer of a court practising without having taken the proper oaths. These penalties are declared by Sir E. Coke to be, "that from the conviction, the defendant shall be out of the king's protection, and his lands and tenements, goods and chattels, forfeited to the king; and that his body shall remain in prison at the king's pleasure; or, as other authorities have it, during life."

When the patricians were compelled to acquiesce in the consulship being thrown open to the plebeians, they stipulated that a new Curule magistrate should be appointed from the patricians exclusively, to act as supreme judge in the civil courts. On this magistrate the title of Practor was bestowed. In B.C. 337, the Pretorship was thrown open to the plebeians. About B.C. 240, the number of aliens residing in Rome had increased to such an extent that it was found necessary to appoint a second Practor, who should decide suits between aliens or between aliens and citizens. He was known as the *Prætor peregrinus*, the other Practor, *Prætor urbanus*, having cognizance of suits between citizens only. In B.C. 227, the number was increased to four, the two additional pretors to act as governors of provinces. By Sulla the number was augmented to eight, by Julius Cæsar to ten, twelve, and eventually to sixteen. The Pretors held their offices for one year, and were afterwards sent out by lot as governors of provinces.

¶ *Precession of the equinoxes:*

(1) *Astron.:* The going forward of the equinoxes. The arrival of the sun at the point Aries a little earlier than he might be expected to reach it was first observed by Hipparchus about 150 B.C. Depending, as the phenomenon does, for its explanation, on the law of gravity, Hipparchus could not account for it. Sir Isaac Newton was the first who did so, and that his newly discovered law of gravitation explained the precession of the equinoxes was a confirmation of the accuracy with which he had read the law itself. Excepting only at the two equinoxes, the plane in which the sun moves in his orbit and that in which the earth rotates do not coincide. By the law of gravitation one body does not attract another in mass, but acts on its separate particles. The sun then does not attract the earth as a whole, but tends to pull the parts nearest it away from those in proximity to the centre, and the centre again away from those on the other side. The bulged-out equatorial zone is specially liable to be thus acted upon, and, but for the rotation of the earth, would be so drawn down towards the ecliptic that it and the equator would ultimately be in one plane. The earth's rotation, however, modifies this action, and simply causes the points at which the earth's equator intersects the plane of the ecliptic to move slowly in a direction opposite to that in which the earth rotates. This is what is denominated the precession of the equinoxes. It is generally associated with the sun, but the moon is twice as potent in producing it; owing to her comparative nearness to the earth she is able to produce a greater differential effect on the nearer and more remote portions of our planet. The annual motion of the first point of Aries is about 50", and about 25,867 years will be required for the entire revolution. [ARIES.]

"But yours the waift by high *prerogative*."
Spenser: F. Q., IV. xii. 31.

II. *Eng. Law:* An exclusive privilege of the Crown, the expression *the* prerogative being employed for the whole or any part of such exclusive privilege. The prerogative may be confined or limited by the supreme legislative authority, and has in fact been much restricted, notably by Magna Charta (1215), the Habeas Corpus Act (1679), the Bill of Rights (1628), and the Act of Settlement (1639). The chief existing prerogatives are

1. *Personal:* In order that the State may never be without a ruler and head, the sovereign is regarded as a corporation; he cannot die, he cannot be under age. He is personally irresponsible for any crime, the responsibility of his acts resting on his ministers. He cannot be guilty of negligence. No lapse of time will bar his right to prosecute; though in civil matters he cannot sue after a lapse of sixty years. He is exempt from taxation and tolls; his person cannot be arrested, nor his goods distrained upon. The palaces which he uses as dwellings are exempt from taxation, as is the disused Holyrood House, whose precincts still afford sanctuary from civil process.

2. *Political:* All land in theory is held of the king. He can dissolve or prorogue parliament, but cannot prolong it beyond seven years. He can refuse assent to a Bill passed by both Houses. He can, with the advice of his Privy Council, issue proclamations, binding only, however, in so far as they do not clash with existing laws. He is not bound by an Act of Parliament unless expressly named there in. He can prevent a subject from leaving the kingdom, by a writ of *ne exeat regno*, and compel the return of a subject from abroad. He is the fountain of honour, and by 13 Car. II., c. 6, in him is vested the command of the army and navy. He alone can coin money, grant charters to corporations, and establish markets and fairs. He is guardian of lunatics, idiots, and infants.

3. *Judicial:* The king is the fountain of justice, and the Supreme Court of Appeal, but he cannot erect tribunals contrary to the law, nor can he add to the jurisdiction of courts. He may intervene in all litigation where his own rights are concerned, or the interests of public justice demand it.

4. *Ecclesiastical:* The statutes 26 Henry VIII., c. 1 and 1 Eliz., c. 1 recognise the king as the Supreme Head of the Church. He convenes and dissolves Convocation (q.v.), and nominates to vacant bishopries [BISHOP, CONGÉ D'ELIRE], but he can erect no new see in England, though he may do so in the Crown colonies.

5. *Fiscal:* A few unimportant feudal dues are still the prerogative of the king; as in the case of treasure-trove, escheats, royal fish, wrecks, waifs, and strays, &c. In theory all these privileges fall within the prerogative of the Crown; yet, with the exception of such as are purely personal, and the conferring of honours (which are usually conferred on the initiative of the Premier), they are exercised by the responsible minister of the Crown, chosen from that party which has, for the time being, a majority in the House of Commons.

* **prerogative-court**, *s.* An ecclesiastical court for the trial of testamentary causes, where the deceased had left effects in two different dioceses. It was abolished, and its jurisdiction transferred to the Court of Probate by the Act 20 & 21 Vict., c. 77.

B. *As substantive:*

Church Hist. & Ecclesiol. (*Pl.*): Those who believe that the government of the church by means of presbyters is "founded on and agreeable to the word of God." They hold that presbyter (elder) and bishop are different names for the same ecclesiastical functionary (cf. Acts xx. 17, 28, R.V., Phil. i. 1, &c.); that, consequently, every presbyter is a bishop, and on a footing of equality with his other brethren in the eldership. Presbyters are divided into two classes—teaching and ruling elders (1 Tim. v. 17). The former are popularly called "ministers," the latter "elders," or "lay-elders;" but, theoretically, both hold spiritual office. The government is by means of four courts of judicature, rising consecutively in dignity and authority. The lowest—called in Scotland, &c., the "Kirk-session," or simply the "Session" [KIRK-SESSION], rules over the congregation in all spiritual matters; while finance, being deemed more secular, is relegated to "deacons or

managers. Above the Session is the Presbytery (q.v.). Above this again is a Synod for a province; it is held half-yearly. Highest of all is the General Assembly, meeting annually. The minister of a congregation presides *ex officio* in the Session, and non-ministerial elders are ineligible for the Moderatorship of the Presbytery, Synod, and Assembly. A Presbyterian denomination stands to an Episcopal one nearly in the same relation as a republic to a monarchy. The Waldensian church was constituted on an essentially presbyterian model. The system was partially introduced into Switzerland in 1541, and its discipline was subsequently carried out by Calvin with iron firmness at Geneva. The first French Synod met in Paris in 1559, the first Dutch Synod at Dort in 1574. The Hungarian and various other continental Protestant churches are also Presbyterian. The system thoroughly rooted itself in Scotland, the first General Assembly being held there in 1560. [CHURCH OF SCOTLAND.] The same year a presbytery was formed in Ireland, at Carrickfergus [SYNOD OF ULSTER], and in 1572 one in England, at Wandsworth. In 1646–7 the Church of England was reconstituted on a presbyterian basis, but in 1660 was again made episcopal. [CHURCH OF ENGLAND.] The clergymen who had to leave the English Church, in 1662, owing to the Act of Uniformity, were mainly Presbyterians. A number of the congregations which they founded ultimately lapsed, first into Arianism, and then into Socinianism, retaining the name Presbyterian after they had abandoned the form of government. But the great mass of the British and American Presbyterians are strongly Trinitarian. They hold the Bible to be the sole rule of belief, and the Confession of Faith their chief, or their only, human standard. In 1836 two presbyteries in England in connection with the Church of Scotland were united into a Synod; two more were added in 1839. In 1843 they asserted their independence of the Scottish Church, calling themselves the "Presbyterian Church in England." In 1876, they and the English congregations of the United Church joined to form the "Presbyterian Church of England." The first presbytery in the New World met at Philadelphia in 1705. There are now powerful Presbyterian churches in America and the British colonies.

The Moderator opens and closes each meeting with prayer. The functions of the court are executive, not legislative. Appeal lies from it to the Synod (q.v.).

A descendant of Aaron, and therefore one of the sacred caste. The Jewish priests filled all the important offices in connection, first with the tabernacle and then with the temple worship, less important ones being handed over to the Levites, and those still more menial to the Nethinims (q.v.). They constituted a sacred hierarchy, of which the high priest was the head. Their chief duties were to offer sacrifices for themselves and the people, and intercede for them with God. The priests were divided into twenty-four courses for the service of the temple (1 Chron. xxiv. 1-19 ; Luke i. 5). Probably the "chief priests" were the heads of these courses, with any high priest out of office (Matt. xxvi. 3).

He divides it into three sub-orders: (1) Anthropidæ, (2) Simiadæ (Apes and Monkeys), and (3) Lemuridæ.

"Moreover, as man is the highest animal, and zoologically considered, differs less from even the lowest ape than such ape differs from any other animal, man and apes must be placed together in one order, which may well bear its primitive Linnæan name, *Primates*."—*Prof. Mivart*, in *Encyc. Means to establish a community at Spaxton, near Charlinch, with Prince at its head, were obtained by "leading captive silly women ;" and the nature of the community is sufficiently indicated by its name—The Agapemone (q.v.). "The principle on which the sect was ultimately consolidated was that Jesus having suffered to redeem the spirit only, and left the flesh alienated from God, Prince took upon himself new flesh to redeem the flesh, and whosoever believes on him will not die, but will henceforth be without sickness or pain." In 1902 public attention was again called to the sect by the claims of the Rev. Smyth Pigott. [Agapemone.]

C. *As substantive:*

1. The act, process, or practice of impressing letters, characters, or figures on paper, cloth, or other material; the business of a printer; typography. There are several branches of the art, as, the printing of books, &c., by means of movable types; the printing of engraved steel or copper plates [Engraving]; the taking impressions from stone [Lithography], and the printing of figured patterns on fabrics [Calico-printing]. Letterpress-printing, or the method of taking impressions from type or letters, and other characters cut or cast in relief upon separate pieces of metal, is the most important branch of printing. The first step towards the invention of printing was the practice of taking impressions of pictures with short descriptions beneath, from blocks of wood carved with a knife. Next followed a series of blocks printed on one side only of the paper, and the leaves pasted together to form a book. The next step was the invention by John Gutenberg of the use of movable metal types cast in a mould. After long experiments at Strasburg, which involved him in a law-suit, Gutenberg removed to Mainz, where he succeeded in producing the Latin Bible about 1452-4, the marvel of after ages for perfection of typography. The first book printed with a date is the Latin Psalter, 1457, the opening page of which has a floriated letter B in three colours, of exquisite beauty of design and execution. The first book printed in Italy was *Lactantius* (Subiaco, 1465); in France, *Pergamensis Epistolæ* (Paris, 1470-1); in England, *The Dictes or Sayings of the Philosophers* (Westminster, 1477); in Spain, *Sallustius* (Valentia, 1474). The first book printed in Holland with a date appeared in 1473. Some maintain that Gutenberg derived his knowledge from Coster of Haarlem. In letterpress printing the impressions are taken directly from the surface of the types, or from stereotyped plates [Stereotype] by superficial pressure, as in the hand printing-press, or by cylindrical pressure, as in the steam printing-machine, or by the action of a roller, as in the copper plate press. The ink or pigment employed is laid upon the surface of the type with a printer's roller. Printing is divided into two departments, composition and press-work. (See these words.) In printing for the blind the letters or characters are impressed in relief on stout paper or cardboard without the use of ink.

2. *Photog.:* The process of obtaining proofs from negatives. [Autotype, Photocollotype, Platinotype, Powder-process, Silver-printing, Stannotype, Woodburytype.]

It is usually of wood, glazed with plate glass, and having a movable back, which is divided and hinged to admit of one half of the print being occasionally raised that its progress may be watched.

printing-machine, *s.* A machine for taking impressions on paper from type, electrotype, or stereotype formes, steel or copper plates, lithographic stones, &c. It is moved by hand, or by steam, or other power. The impression from the formes is generally effected by cylindrical pressure. Letterpress printing machines are of three kinds: (1) Single cylinder, by which the sheet of paper is printed on one side only; (2) Perfecting, which prints both sides of the sheet at one operation; and (3) Platen, which prints one side of the sheet by flat, instead of cylindrical, pressure. There are also various kinds of Rotary machines used for printing newspapers, into which the paper is drawn from reels, instead of being fed by single sheets. The first cylinder printing-machine was patented by W. Nicholson in 1790. On Nov. 29, 1814, the *Times* was for the first time printed by machinery, at the rate of 1,100 copies per hour, by a machine invented by Konig. This machine was, however, very complicated, and was soon after superseded by one invented by Messrs. Applegarth and Cowper, in 1827, by which a rate of 8,000 copies per hour was attained. Since then successive improvements have been made, enabling as many as 30,000 or more copies per hour to be printed.

printing-paper, *s.* Paper used in printing books, papers, &c., as distinguished from writing-paper, wrapping-paper, &c. [Paper.]

A contrivance for running the forme in and out was afterwards added. In the printing-press the matter to be printed is laid on an even horizontal surface, usually of iron, and the pressure is produced by a parallel surface, also usually of iron, called a platen, by means of a screw or lever, or both combined.

It was thus a mark of superiority due to personal qualities, rather than an official title of dignity. Priors are now of two kinds: Conventual and Claustral. A conventual prior is the head of a religious house, either independently, as among the Regular Canons, the Carthusians, and the Dominicans, or as superior of a cell or offshoot from some larger monastery. * **privy-coat,** *s.* A light coat or defence of mail worn concealed under the ordinary dress.

privy council, *s.* The principal Council of the sovereign, consisting of members chosen at his or her pleasure. Its dissolution depends upon the royal pleasure; by common law it was dissolved *ipso facto* by the demise of the sovereign, but to prevent the inconvenience of having no council in being at the accession of a new prince, the privy council is enabled by statute to continue for six months after the demise of the crown, unless sooner dissolved by the successor. It is presided over by the Lord President of the Council, who has precedence next after the Lord Chancellor. Members of the privy council are addressed as Right Honourable. The duty of a privy councillor appears from the oath, which consists of seven articles:

1. To advise the king according to the best of his cunning and discretion; 2. To advise for the king's honour and good of the public, without partiality through affection, love, meed, doubt, or dread; 3. To keep the king's counsel secret; 4. To avoid corruption; 5. To help and strengthen the execution of what shall be there resolved; 6. To withstand all persons who would attempt the contrary; and lastly, in general, 7. To observe, keep, and do all that a good and true councillor ought to do to his sovereign lord.

The office of a privy councillor is now confined to advising the sovereign in the discharge of executive, legislative, and judicial duties. The former have, since the accession of Queen Anne, been entrusted to responsible ministers; and it has consequently become the settled practice to summon to the meetings of the council those members of it only who are the ministers of the crown. The power of the privy council is to inquire into all offences against the government, and to commit the offenders for trial; but their jurisdiction is only to inquire and not to punish, except in the case of the judicial committee, which has full power to punish for contempt and to award costs. The duties of the privy council are, to a great extent, performed by committees, as the judicial committee, who hear allegations and proofs, and report to the sovereign, by whom judgment is finally given, and the committee of council on education, presided over by the Vice-president of the Council, who is a member of the government.

From Medina's death till about 1650 Probabilism flourished, and then a reaction set in in favour of Probabiliorism (q.v.). St. Alphonsus Liguori (1732–87) in his *Homo Apostolicus* and *Theologia Moralis* revived Probabilism, which is now the ordinary rule of confessors in the Roman Church.

The word chance is here used to signify the occurrence of any event in a particular way, when there are two or more ways in which it may occur, and when there is no reason why it should happen in one way rather than in another. One of the most common and useful application of the methods of probabilities is, in computing the elements employed in the subject of annuities, reversions, assurances, and other interests, depending upon the probable duration of human life.

3. *Law:* A term applied to the whole course of proceedings in a cause, real or personal, civil or criminal, from the original writ to the end of the suit; properly, the summons citing the party affected to appear in court at the return of the original writ. This was sometimes called original process, being founded upon the original writ; and also to distinguish it from mesne or intermediate process, which issues, pending the suit, upon some collateral interlocutory matter; as to summon witnesses, and the like. Mesne process is also sometimes put in contradistinction to final process or process of execution; and then it signifies all such process as intervenes between the beginning and end of a suit. Formerly the superior common-law courts differed greatly in their mode of procedure in the case of personal actions: thus, in the Court of Queen's Bench a plaintiff might proceed by original writ, but the more usual method was by a species of process entitled a Bill of Middlesex, so entitled because the court generally sat in that county. In the Exchequer the first process was by a writ of *quo minus*, in order to give the court a jurisdiction over pleas between party and party, in which the plaintiff was alleged to be the king's farmer or debtor, and that the defendant had done him the injury complained of, *quo minus sufficiens existit*, by which he was the less able to pay the king his rent or debt. And upon this the defendant might have been arrested as upon a capias from the Common Pleas. By the Process Uniformity Act, the procedure in all personal actions except replevin, is the same in all the courts, and all actions are now commenced by a writ of summons, under the seal of the court in which the action is brought, directed to the defendant, and commanding him to cause an appearance to be entered for him on a certain day. In ecclesiastical suits the mode of commencing an action is by process termed a citation or summons, containing the name of the judge, the plaintiff, and the defendant, the cause of complaint, and the time and place of appearance. In Scots law, process is used for the proceedings in a cause, and for the connected documents.

¶ *Procession of the Holy Ghost:*

1. *Theol.:* The noun procession is not found in Scripture, it was, however, legitimately framed by theologians from the verb occurring in John xv. 26, "The Spirit of truth, which proceedeth from the Father." There is no similar passage categorically stating procession from the Son, and the question arises, can equivalent language be found? If the words in John xiv. 26, "The Comforter, which is the Holy Ghost, whom the Father will send in my name," imply the procession of the Holy Ghost, so do those in xv. 26, "But when the Comforter is come, whom I will send unto you from the Father," and there is a Procession of the Holy Ghost from the Son as well as from the Father, if they are not equivalent there is no procession from the Son. (Cf. Gal. iv. 6.)

2. *Church Hist.:* The clause "filioque" [Nicene Creed], implying procession from the Father and the Son, being accepted in the West while rejected in the East, was one potent cause of the ultimate separation between the Greek and Latin Churches. [Greek-Church.] The clause was accepted by the Reformed Churches and by Nonconformists generally, and appears in the Presbyterian Confession of Faith (ch. ii., § 3).

¶ (1) *Promise and offer:*

Scots Law: An offer is a proposal made by the offerer to the person to whom the offer is addressed, to give or to do something either gratuitously or on an onerous consideration. A promise is an offer with this addition, that

the promiser, from the nature of his proposal, thinks it unnecessary to wait for the other party's assent, which he takes for granted. An offerer is not bound until his offer is accepted. A promiser is bound as soon as the promise reaches the party to whom it is made. A promise may be absolute or conditional, lawful or unlawful, express or implied. An absolute promise must be fulfilled in all events. The obligation to fulfil a conditional promise depends on the performance of the condition. An unlawful promise is not binding, being void by the nature of it, as being incompatible with a prior paramount obligation of obedience to the laws. An express promise is one expressed in words or writing. An implied promise is one which reason and justice dictate. A promise without deed is said to be parol, and the term is usually applied to engagement by parol only, a promise by deed being technically called a covenant (q.v.).

¶ Some consider every Scripture prophecy as having but a single sense and a single fulfilment; some, a double sense, the first referring to a near event, the second to a remote one, specially the mission or death of Christ. Extreme rationalists, on the contrary, deny that predictions exist. The fulfilment of prophecy is deemed one of the leading branches of Christian evidence.

Then every minister successively, beginning with the youngest, did handle one and the same part of Scripture."—*Bacon: Pacification of the Church.*

2. An interpreter, a spokesman.

"I have made thee a god to Pharaoh: and Aaron thy brother shall be thy *prophet*."—*Exodus* vii. 1.

1. *The Prophets:*

(1) Men divinely inspired, and who often uttered predictions of future events. Three words are applied to the Old Testament prophets; the most common is נָבִיא (*nabhi*), from the verb נָבָא (*nabha*) = primarily, to bubble forth, to send forth copious floods of speech, hence in Niphal = to speak under a divine impulse, to prophesy (1 Sam. ix. 9; 1 Kings xx. 13); the second רֹאֶה (*rōĕh*) = a seer, from רָאָה (*raah*) = to see (1 Sam. ix. 9), and the third חוֹזֶה (*chhōzĕh*) = a seer, from חָזָה (*chhazah*) = to see, to look (1 Chron. xxi. 9; xxv. 5, &c.). It is connected with חָזוֹן (*chhazon*) = a vision. The second term was the oldest (1 Sam. ix. 9). Both it and *chhozeh* suggest that the subjects of the prophecies passed before the eyes of the seer in panoramic vision (cf. Isaiah i. 1; Ezek. i. 4; Rev. i. 12), he simply recording what he saw. In many cases, however, words were communicated (Jer. i. 4, 9, 11, 12). The first word *nabhi*, suggested that when inspired communications had to be made, the prophet, like a frenzied person raving, uttered words in a copious flood, flowing forth with some considerable impulse. Abraham is called a prophet (Gen. xx. 7); it is implied that Moses was one (Deut. xviii. 15; Acts vii. 37), but the more typical prophets began with Samuel (Acts xiii. 20), who was a civil ruler as well. Yet the full development of the prophetic order was not till the separation between the two kingdoms. In Judah the general faithfulness to Jehovah left them less scope. In the kingdom of Israel, on the other hand, where the worship, even when nominally that of Jehovah, was idolatrous, and where that of Baal often prevailed, the prophets were very prominent and influential, denouncing apostasy and moral depravity. The first, like Elijah, Elisha, &c. have left no writings; the later prophets have. [(2).] The last of the Old Testament prophets passed away with Malachi, and scribes took their place. In the early church there were prophets (Rom. xii. 6; 1 Cor. xii. 28; Ephes. iv. 11, &c.). Their chief function seems to have been preaching in the church (1 Cor. xiv. 2–5).

(2) The prophetic books of the Old Testament, or the Old Testament except the books of Moses (Matt. xxii. 40; Luke xxiv. 27).

2. *School of the Prophets:* An association of the prophets in which the elder lovingly trained the younger, who were called their sons (1 Kings xx. 35). First Elijah, and then Elisha, presided over such a society.

I. *Ordinary Language*:

1. The comparative relation of one thing to another as regards size, quantity, extent, degree, &c.; ratio.

"Gold incorporates with copper in any *proportion*."—*Bacon: Works*, i. 113.

2. Settled relation of comparative quantity; equal or corresponding degree.

II. *Technically*:

1. *Arch., Art, &c.*: That due observance of the balance of all parts, in a statue or picture, which constitutes excellence.

2. *Arith.*: A rule by which from three given quantities a fourth may be found bearing the same ratio to the third as the second bears to the first. Also called the Rule of Three.

3. *Math.*: The relation which one quantity bears to another of the same kind, with respect to magnitude or numerical value. This relation may be expressed in two ways: (1) by the difference of the quantities, and (2) by their quotient. When the relation is expressed by their difference, it is called an Arithmetical Proportion; when by their quotient, Geometrical Proportion, or simply Proportion. Four quantities are in proportion when the ratio of the first to the second is equal to the ratio of the third to the fourth; this relation is expressed algebraically thus, $a : b :: c : d$. This expression is called a proportion; it is read, a is to b as c is to d, and is equivalent to the expression $\frac{b}{a} = \frac{d}{c}$. Hence, a proportion may be defined to be the algebraic expression of equality of ratios.

¶ (1) *Compound proportion*: The equality of the ratio of two quantities to another ratio, the antecedent and consequent of which are respectively the products of the antecedents and consequents of two or more ratios.

(2) *Continued proportion*: [CONTINUED, ¶ (4)].

(3) *Harmonical* (or *musical*) *proportion*: [HARMONICAL-PROPORTION].

(4) *Reciprocal proportion*: A proportion in which the first term is to the second as the fourth to the third, 4 : 2 : : 3 : 6.

(5) *Rhythmical proportion*:

(6) *Simple proportion*: The relation of equality subsisting between two ratios.

1. To cover, shield, or defend from injury, harm, hurt, or danger of any kind. It is a word of very general import, both literally and figuratively: thus, a house *protects* us from the weather, a fort *protects* a harbour from the enemy, clothes *protect* the body from cold, a shade *protects* us from the heat of the sun, a father *protects* his children, &c.

I. *Ordinary Language:*

1. The act of protecting; the state of being protected; defence; shelter from danger, hurt, injury, or evil; preservation from anything hurtful or annoying.

"No one doubts that both sexes of many birds have had their colours adapted for the sake of *protection.*"—*Darwin: Descent of Man*, pt. ii., ch. xvi.

2. That which protects, shelters, or preserves from danger, injury, or evil; a shelter, a defence: as, Clothes are a *protection* against the cold.

4. Exemption from arrest in civil suits. [Arrest, *s.*, B. I. 1.] Also a special protection given by virtue of the royal prerogative against suits in law or other vexations, in respect of the party being engaged in the sovereign's service.

II. *Polit. Economy:* Protection in this sense is said to have been derived from the name of the Society for the Protection of Agriculture (1844-53). But the idea is old, and has been known to a greater or less extent in all ages and in all lands. Taxes levied solely for the raising of revenue operate in restraint of free trade, and are therefore a form of protection, but the term is generally limited to cases in which these taxes are imposed for other than fiscal purposes. Their most common aim is to shield some languishing trade, occupation, or profession from open competition. Free Traders urge that protection to the farmer makes every loaf smaller, thus taxing for the benefit of a class the very poorest person in the country, and aggravating the effects of any famine that may arise. [Corn-laws.] Navigation laws make it more expensive to work a ship, and diminish the probability of its being largely employed in the carrying trade of the world. [Navigation-laws.] A bounty on exportation is a present made to foreign countries, and *vice versâ.* [Bounty.] It is believed that the protectionist system on a large scale was first proposed by the Chancellor de Birague, an Italian in the suite of Catherine de Medici. It was developed by Colbert in 1664, and has not since passed away. In 1692 England retaliated on France, according to Adam Smith, taxing goods imported from that country in 1696 75 per cent. or more. Bounties were abolished in Britain between 1818 and 1824, and this, with the repeal of the Corn and Navigation Laws, dealt a severe blow to the protectionist system in this country. Since then the "Revivers" have attempted to restore Protection to its former position. Some of its doctrines have been advocated under the name first of Reciprocity and then of Fair Trade. [Trade.] In 1903 the advocacy of Protection, especially in the form of Retaliatory and Preferential Tariffs, was actively revived by Mr. Joseph Chamberlain and his followers. In many of the colonies, and in the United States, protection still carries with it the mass of the people and the government, though a minority are in favour of Free Trade.

prō-tō-plăsm, †prō-tō-plăs'-mą, *s.* [Gr. πρῶτος (*prōtos*) = first, and πλάσμα (*plasma*) = anything formed or moulded.]

Biol., &c.: "The living matter from which all kinds of living beings are formed and developed, and to the properties of which all their functions are ultimately referred" (*Encyc. Brit.*, ed. 9th, xix. 828). It was first noticed and described by Roesel v Rosenhof, in his account of the Proteus-animalcule, and was named sarcode by Dujardin in 1835. In 1846 v. Mohl gave the name protoplasm to the "tough slimy granular, semi-fluid" portion of the contents of the vegetable cell. Colin suggested the identity of vegetable protoplasm and animal sarcode, which was established by Schultze (*Arch. f. Anat. u. Phys.* (Leipzig), 1861, pp. 1–27), whose conclusions were probably aided by the researches of De Bary and Koelliker. Protoplasm is a transparent homogeneous, or granular-looking substance. Under high microscopic power, in many instances, it shows a more or less definite structure, composed of fibrils more or less regular, and in some instances grouped into a honeycombed or fibrillar reticulum, in the meshes of which is a homogeneous interstitial substance. The closer the meshes of the reticulum, the less there is of this interstitial substance, and the more regularly granular does it appear. Water, dilute acids, and alkalies cause protoplasm to swell up, and ultimately become disintegrated, and it is coagulated by those substances that coagulate proteids. Its composition is a problem with which science has still to deal.

"It is now known that in the embryo and adult, in plant and animal, vertebrates and invertebrates, all kinds of cells, before their *protoplasm* undergoes division, show complicated change of their nucleus, leading to division."—*Klein: Elements Histology*, p. 7.

prō-tō-zō-ą, *s. pl.* [Protozoon.]

Zool.: A group of animals, occupying the lowest place in the animal kingdom. They consist of a single cell, or of a group of cells not differentiated into two or more tissues; incapable, as a rule, of assimilating nitrogen in its diffusible compounds (ammonia or nitrates, or carbon in the form of carbonates). The food is taken into the protoplasm, either by a specialised mouth or by any part of the cell substance, in the form of particles. Prof. Ray Lankester (*Encyc. Brit.* (ed. 9th), xix. 830-66) has brought together the results of the latest investigations on the nature of these minute organisms, and adds full bibliography. He divides them into two grades:

1. Gymnomyxa, with seven classes—Proteomyxa, Myxetozoa, Lobosa, Labyrinthulidea, Heliozoa, Reticularia, and Radiolaria.

I. *Ordinary Language:*

2. A by-word; an expression or name of contempt, hatred, or reproach. (1 *Kings* ix. 7.)

II. *Scripture:*

1. A moral saying or maxim, enigmatical or allegorical in its nature. (*Proverbs* i. 6.)

2. (*Pl.*) *Old Test. Canon:* Heb. מִשְׁלֵי (*mishlê*), pl. of מָשָׁל (*mashâl*) = (1) a similitude, a parable (Ezek. xvii. 2, xxiv. 3); (2) a pithy saying, generally involving latent comparison; (3) a proverb properly so-called; (4) a song or poem, prophetic (Num. xxiii. 7, 18), didactic (Job xxvii. 1), or derisive (Isaiah xiv. 4), &c. The noun, מָשָׁל (*mashâl*), is from the verb מָשַׁל (*mashal*) = to make like, to assimilate. (*Gesenius.*) It was therefore to be expected that the book of Proverbs would not consist exclusively of proverbs properly so called; nor does it. For instance, ch. ii. is not a series of detached sayings, but a didactic treatise. Dr. Otto Zöckler (*Prov. Solomon* (ed. Aiken), pp. 35–37) divides the Book into five leading portions: (1) Introductory (i. 7–ix. 18); (2) original nucleus of the collection, genuine Proverbs of Solomon (x. 1–xxii. 16); (3) additions made before Hezekiah's day (xxii. 17–xxiv. 34); (4) gleanings by the men of Hezekiah (xxv.–xxix.); (5) the Supplements (xxx.–xxxi.), the first being the words of Agur (xxx.), and the second the words of Lemuel, with the poem in praise of the matron (xxxi.). Chapter xxxi. 10–31 constitutes an alphabetical acrostic. Chapters i.–xxix. are generally attributed to Solomon, who was "wiser than all men," and "spake 3,000 proverbs" (1 Kings iv. 31, 32), which do not seem to have been founded solely on his own experience, but on the shrewd observation of the nation at large (i. 6). The collection made under Hezekiah repeats many proverbs which appeared in the earlier one. The lives of Agur and of King Lemuel's mother, and the dates of the two appendices ascribed to them, are unknown. The New Testament directly quotes from this book in very many instances.

Cf. Prov. iii. 11, 12 with Heb. xii. 5, 6, Rev. iii. 19; Prov. iii. 34 with James iv. 6; Prov. xi. 31 with 1 Pet. iv. 18; Prov. xxv. 21, 22 with Rom. xii. 20; Prov. xxvi. 11 with 2 Pet. ii. 22. Allusion is made to Prov. i. 16 in Rom. iii. 15; to Prov. iii. 7 in Rom. xii. 16, and to Prov. x. 12 in 1 Pet. iv. 8.

F. *psalme, salme*; Fr. *psaume*; Sp. & Ital. *salmo*; Port. *psalmo*.] A sacred song or hymn; a song or hymn composed on sacred subjects, and in praise or worship of God; espec. one of the hymns composed by David, and other Jewish sacred writers.

¶ *The Book of Psalms:*

Old Test. Canon.: Heb. תְּהִלִּים (*tĕchillīm* or *tĕchillim*), an abnormal pl. of masc. form to the fem. תְּהִלָּה (*techillah* or *tehillah*) = (1) praise; (2) a hymn of praise; (3) glory. In one codex the Septuagint calls the book Ψαλμοί (*Psalmoi*) = Psalms; in another Ψαλτήριον (*psalterion*) = a stringed instrument. It was the praise-book or psalter of the Hebrew temple or synagogues. In the present Hebrew Bibles it is placed just after the Prophets at the head of the Hagiographa (q.v.), and in Luke xxiv. 44, is generally supposed to stand for that division of the Old Testament books. The hundred and fifty psalms are arranged in Hebrew in five books, each terminating with a doxology, in some cases closing with "Amen and amen." The R.V. prints them separately. Book 1 contains i.-xli.; book 2, xlii.-lxxii.; book 3, lxxiii.-lxxxix.; book 4, xc.-cvi., and book 5, cvii.-cl. All but thirty-four psalms have titles in the Hebrew Bible: the latter were called by the Rabbins orphan psalms. In the Septuagint all but two have titles. Though not as a rule accepted as part of Scripture, they are ancient, and worthy of high respect. They attribute all Book 1 to David, except Ps. i., ii., x., and xxxiii. The name of the Supreme Being used in this book is chiefly Jehovah. Book 2 assigns Psalms to David, to Korah, to Asaph, and to Solomon, and leaves others anonymous. The name for the Supreme Being in this book is Elohim (q.v.). Book 3 ascribes Psalms to David, to Korah, to Asaph, to Ethan, and to Heman the Ezrahite. Elohim and Jehovah are about equally common in the book, the former, however, being apparently preferred. Book 4 ascribes Psalm xc. to Moses, the others not anonymous to David. Book 5 leaves many psalms anonymous, attributing others to David. The Hebrew Bible, but not the Septuagint, assigns Psalm cxxvii. to Solomon. This volume contains the Songs of Degrees. The book was evidently brought together from many sources. It was commenced, rather than entirely composed, by David. Its composition and compilation extended over centuries. Psalm cxxxvii. speaks of the Babylonish captivity as an event recently gone by. Psalm xliv. and lxxix. seem very suitable to the time of the persecution under Antiochus Epiphanes (B.C. 168-165). If the Talmudic statement, discovered by Gratz, that the night service alluded to in Psalm cxxxiv. did not become part of the Jewish ritual till the time of Queen Alexandra (B.C. 79-70), it, and perhaps others of the Songs of Degrees may be slightly more recent than that date. The book of Psalms is quoted or alluded to as an inspired composition by Our Saviour and his Apostles at least seventy times: no Old Testament book is more frequently quoted. Its canonical authority has never been seriously doubted. It has become the psalter of the Christian Church. Its rhythmical form and careful parallelism (q.v.) (now rendered obvious by the R.V.) adapt it for the musical part of public worship. [MESSIANIC.]

When lobate, the *pseudopodia* remain distinct from one another, their margins are clear and transparent, and the granules which they may contain plainly flow into their interior from the more fluid central part of the body. But, when they are filiform, they are very apt to run into one another, and give rise to nets or webs, the constituent filaments of which, however, readily separate, and regain their previous form; and whether they do this or not, the surfaces of these *pseudopodia* are often beset by minute granules which are in incessant motion."—*Huxley: Anat. Biol.: (See extract).

"The young [of viviparous Aphides] are developed within organs which resemble the ovarioles of the true females in their disposition, and may be termed *pseudovaries.* The . . . anterior chamber of each pseudovarian tube is lined by an epithelium, which encloses a number of nucleated cells. One of the hindermost of these cells enlarges, and becomes detached from the rest as a pseudovum. It then divides, and gives rise to a cellular mass . . . which gradually becomes fashioned into the body of a larval Aphis. A portion of the cells of which it is composed becomes converted into a *pseudovarium*, and the development of new pseudova commences before the young leaves the body of its parent. It is obvious that this operation is comparable to a kind of budding. If the pseudovum remained adherent to the parental body the analogy would be complete."—*Huxley: Anat. Invert.*, pp. 447, 448.

PTEROPUS.

"Any one who has seen a colony of these Bats suspended from the branches of a banyan-tree, or from a silk-cotton tree, must have been struck with their resemblance to large ripe fruits; and this is especially noticeable when they hang in clusters from the leaf-stalks of the cocoanut-palm, where they may be easily mistaken for a bunch of ripe cocoanuts."

Supported by this finger, the side of the body, and the comparatively short hind limb, was a patagium, or flying membrane. The bones were pneumatic. Chief genera: Pterodactylus, Dimorphodon, Rhamphorhynchus, Pteranodon, and Ornithopterus. Prof. Seeley, having regard to the ornithic type of brain, and the pneumaticity of the bones of the Pterosauria, places them in a distinct class, Ornithosauria which he regards as most nearly related to, but coequal with, the class Aves. Marsh separated from the order the group Pteranodontia (q.v.), in which he has been followed by Gunther and St. G. Mivart.

By extension, the name is applied to other species of the genus. The Common Puffin is well known all round the British coasts, and gives its name to one of its haunts—Puffin Island, off Anglesea. It is rather larger than a pigeon; plumage glossy black above, under-surface pure white; feet orange-red; bill very deep, and flattened laterally, particoloured—red, yellow, and blue, and grooved during the breeding-season, and undergoing a kind of moult at its close—a peculiarity shared by other species. (Cf. *W. Bingley: Tour Round North Wales*, i. 309, and a paper by Dr. Bureau, in *Bull. Soc. Zool. France*, ii. 377–399, an abstract of which appeared in the *Zoologist*, July, 1878.) Puffins lay a single egg—white, with gray markings—in a burrow sometimes excavated by themselves, but frequently in one from which a rabbit has been driven. They were formerly used for food, and, being "reputed for fish" (*Carew: Surv. Corn.*, fol. 35), were eaten in Lent.

It is right, however, to state that Cæsius expressly declares (*Horior. anim. lib.*, fol. 21) that the name is derived '*a naturali voce pupin.*' Prof. Skeat says that the word is a diminutive, which favours the view that it was originally used as a name for these young birds."—*Prof. Newton*, in *Encyc. For the transference of sense cf. *horse* = a kind of frame; Fr. *poutre* = a filly . . . a beam; *chèvre* = a goat . . . a crane; Eng. *crane* = in its double meaning; Gr. ὄνος (*onos*) = an ass, a crane, a pulley, &c.]

1. *Mech.:* One of the six simple machines or mechanical powers. It consists of a small circular plate or wheel which can turn round an axis passing through the centres of its faces, and having its ends supported by a framework which is called the block. The circular plate has a groove cut in its edge to prevent a string from slipping off when it is put round the pulley. With a single fixed pulley (that is one in which the block in which the pulley turns is fixed), there is neither gain nor loss of power; for, as the tension in every part of the cord is the same, if a weight be suspended at one extremity, an equal weight must be applied at the other to maintain equilibrium. Hence, the effect of a fixed pulley is simply to change the direction of a force. By means of moveable pulleys one can gain mechanical advantage, greater or less, according to the number and mode of combination of the pulleys. This advantage may be computed by comparing the velocity of the weight raised with that of the moving power, according to the principle of virtual velocities. Thus:

In a single moveable pulley with the strings parallel when there is equilibrium the weight is twice the power.

It may, therefore, be considered a lever of the second class, in which the distance of the power from the fulcrum is double that of the weight from the fulcrum.

In a system of pulleys in which each pulley hangs by a separate string and all the pulleys are parallel, when there is equilibrium the weight is equal to the power multiplied by $2n$, where n is the number of pulleys.

In a system of pulleys in which the same string passes round all the pulleys and the parts of it between the pulleys are parallel, when there is equilibrium the weight is equal to the power multiplied by the number of strings at the lower block.

In a system of pulleys in which each string is attached to the weight, and all the strings are parallel when there is equilibrium, the weight is equal to the power multiplied by 2^n-1, where n is the number of pulleys.

Hindu Lore: The last great division of Hindu sacred literature. Eighteen principal Puranas are enumerated, called Brâhma, Pâdma, Brahmanda, Agni, Vishnu, Gâruda, Brahmavaivarta, Siva, Linga, Nâradiya, Skanda, Mârkandeya, Bhavishyat, Matsya, Vârâha, Kaurma, Vâman, and Bhâgavat. None of them is dated. Some quote from others, and the period of their redaction embraces perhaps a dozen centuries. In their present form none of them appears older than the ninth century A.D. The most celebrated are the Vishnu and the Bhâgavat Purânas. They are full of legends relating to holy places and ceremonial rites, with minute fragments of history. Modern Hinduism is largely founded on these compositions, some of which are sectarian productions, advocating

the claims of particular divinities to the disparagement of others. In addition to the eighteen principal Purânas, there are eighteen Upapurânas or secondary Purânas, enumerated by H. H. Wilson (*Vishnu Purâna*, Introd.), and these do not complete the list of Puranic literature.

"The idea of *purgatorial* suffering, which hardly seems to have entered the minds of the lower races, expands to immense vigour in the great Aryan religions of Asia. In Brahmanism and Buddhism, the working out of good and evil actions into the necessary consequence of happiness and misery is the very key to the philosophy of life, whether the successive transmigrations be in animal, or human, or demon births on earth, or in luxurious heavenly places of gold and jewels, or in the agonizing hells where oriental fancy riots in the hideous inventory of torture."—*Tylor: Prim. (*Addis & Arnold.*) The existence of a purgatory was defined by the Councils of Florence (1438-9) and Trent. At the latter council (sess. xxv., Dec. 3, 4, 1563) it was declared that the "souls in Purgatory are assisted by the suffrages of the faithful, and especially by the Sacrifice of the altar." Beyond this nothing is defined, and the same decree enjoins bishops "to abstain from difficult and subtle questions" in their discourses on the subject, and prohibits curious inquiries, superstitious practices, and the making of purgatory a source of gain as "scandals and stumbling-blocks to the faithful."

3. *Anglican:* Art. XXII. treats of Purgatory, and most Protestants consider that it denies Scriptural evidence for the existence of such a place. High Churchmen, on the contrary, hold that the Anglican Church has no authoritative teaching on the point, and that the article is rather directed against an erroneous view of the Roman doctrine than that doctrine itself. Prayers for the dead—the natural outcome of the doctrine of purgatory—are in many instances offered privately by her members, and in some few instances publicly requested in her churches.

On these festive days the book of Esther is read, presents are interchanged, and gifts are sent to the poor. Church Hist.: The name given, at first perhaps in contempt, to those clergymen and others in the reign of Queen Elizabeth who desired a simpler and what they considered to be a purer form of worship than the civil and ecclesiastical authorities sanctioned. The Puritan controversy commenced as early as 1550, when Hooper, appointed to the See of Gloucester, refused to be consecrated in the ecclesiastical vestments then in use. The name first given to those who objected to vestments and ceremonies was Nonconformists. According to Fuller it was not till 1564, or according to Strype till 1569, that the name Puritan arose. When, towards the close of Queen Elizabeth's reign, many of the Anglican clergy began to lean towards Arminianism, the Puritans remained sternly Calvinistic. 1. *Ord. Lang. & Chem.:* The apparently spontaneous decomposition of organic substances, especially those rich in nitrogen. It differs from fermentation (q.v.) in being accompanied by the evolution of fetid and noxious gases. In the process of putrefaction, organic bodies of a higher order are changed, sometimes into lower organic compounds, sometimes into inorganic compounds, as ammonia, sulphuretted hydrogen, &c., and sometimes into simple substances, as hydrogen and nitrogen. Putrefaction may be prevented, or its further progress arrested by various means:

(1) By keeping the substance in a vacuum, or in a vessel containing air which has been deprived of all organic germs.
(2) By freeing from moisture and keeping perfectly dry.
(3) By keeping the substance in an atmosphere a few degrees above 0°.
(4) By heating to the boiling point, and hermetically sealing.

From experiments made by Pasteur and others, it appears that putrefaction only takes place when a body comes in contact with living germs. (Used also figuratively.)

1. *Egyptian Antiquities:* A solid structure substantially invariable in form, viz., a simple mass resting on a square or sometimes approximately square base, with the sides facing with slight deviations towards the four principal winds, and tapering off gradually towards the top to a point or to a flat surface, as a substitute for an apex. The proportion of the base to the height is not always the same, nor is the angle of inclination uniform. The pyramids were constructed in platforms, and then revêted or coated with blocks or slabs of granite, as may still be observed in incomplete pyramids. Recently the theory has been maintained that in the case of the largest pyramids, a smaller one was erected as a nucleus, and subsequently enveloped by another layer. The interior of these massive structures contains narrow passages, and some totally dark halls or chambers, and probably served as the burial-places of the kings who had caused them to be constructed. The entrance to these buildings is raised considerably above the level of the base, and was blocked up by a portcullis of granite, so as to be on ordinary occasions inaccessible. In the pyramid of Cheops, the entrance is raised about 47 ft. 6 in. above the base. The pyramids of Egypt begin immediately south of Cairo, and continue southwards at varying intervals for nearly seventy miles. The largest is that of Cheops, at Ghizeh, standing on a base each side of which was originally 764 feet long, but owing to the removal of the coating is now only 746 feet. Its perpendicular height, according to Wilkinson, was originally 480 ft. 9 in., present height 460 ft. The principal chamber, the so-called Crowning Hall or King's Chamber, is 34 ft. 3 in. long, and 17 ft. 1 in. wide. Its roof is formed of massive blocks of granite, over which, with a view to support the weight, other blocks are laid, with clear intervals between. According to Herodotus, the erection of this pyramid employed 100,000 men for twenty years.

5. *Crystal.:* A polyhedron bounded by a polygon, having any number of sides, called the base, and by triangles uniting at a common point, called the vertex. Pyramids take different names according to the number of their bases. They may be triangular, quadrangular, &c., according as their bases are triangles, quadrilaterals, pentagons, &c. The [illegible] lateral triangles are called faces, the lines in which the faces [illegible] the points in which the edges [illegible] called vertices of the pyramid. pŷ-rŏm-ĕ-tĕr, *s.* [Pref. *pyro-*, and Eng. *meter* (q.v.).] A term originally applied to an instrument in the form of a single metallic bar, employed by Musschenbroek about 1730, to indicate temperatures above the boiling point of mercury, 660° Fahr. It is now applied to any instrument used for such purpose. The first which came into extensive use was that of Wedgwood, about 1780; it was devised and used by him for testing the heat of his pottery and porcelain kilns. No fewer than eleven different modes have been proposed or actually employed for measuring high temperatures: (1) by contraction of clay on exposure to heat, as in Wedgwood's; (2) by expansion of bars of different metals; (3) by change of pressure in confined gases; (4) by the amount of heat imparted to a cold mass; (5) by the fusing-point of solids; (6) by conduction and radiation of heat, depending upon observations with thermometers of moderate range at relative distances [Pyaoscope]; (7) by colour, as red and white heat; (8) by change in velocity of sounds depending on the change of pitch in musical notes; (9) by resolution of chemical compounds; (10) by generation of electricity, as in Becquerel's thermo-electric pyrometer; (11) by change in resistance to electricity, as in Siemens's pyrometer, which depends on the increased resistance offered by an iron or platinum wire to the passage of electricity. Of all these, the third (M. Lamy's), depending on the measurement of the tension of carbonic-acid gas developed from marble when heated, and the last are the best.
¶ Tremeschini's pyrometer is founded on the expansion of a thin plate of platinum, heated by a mass of metal previously raised to the temperature of the medium. The Trampler pyrometer is based upon the difference in the coefficients of dilatation for iron and graphite; the Gauntlet pyrometer on the difference of those of iron and fire-clay. The Ducomet pyrometer consists of a series of rings made of alloys which have slightly different melting points. In pyrometers constructed on the Watertype principle, the temperature is determined by noting the amount of heat communicated to a current of water of known temperature circulating in the medium to be observed. (*Nature*, xxx. (1884), pp. 366, 367.)

The residue obtained by heating the spirit with slaked lime is treated with hydrochloric acid, and the insoluble portion is several times digested in boiling alcohol. The last decoctions contain the pyroxanthin. It forms colourless, needle-shaped crystals, insoluble in water, soluble in alcohol and ether, and dissolving with deep red colour in strong sulphuric acid. Melts at 144°.

Chem. : The constituent in crude wood naphtha which is supposed to yield pyroxanthin by the action of alkalis.

pyr·ox·ene, *s.* [Pref. *pyro-*, and Gr. ξενος (*xenos*) = a stranger.]

Min. : A name used for a group of minerals of very variable composition and origin, but all of which are referable (like the analogous group of amphiboles) to the same chemical type, under the general formula $ROSiO_3$, where R may represent lime, magnesia, the protoxides of iron and manganese, and sometimes soda, potash, and oxide of zinc. Two or more of these bases are always present, the most frequent being lime, magnesia, and protoxide of iron, lime being always present and in a large percentage. Sometimes these bases are replaced by sesquioxides, but always sparingly. The result of these isomorphous replacements is shown in the diversity of habit, colour, and form of its numerous varieties. Crystallization monoclinic. Hardness, 5 to 6; sp. gr. 3·23 to 3·5; lustre, vitreous to resinous; colour, shades of green, and white to black; transparent to opaque; fracture, conchoidal. The two most important divisions are Non-aluminous and Aluminous. Dana subdivides these into:

Non-aluminous: 1. Lime-magnesia pyroxene: (1) malacolite; (2) alalite; (3) traversellite; (4) unsilite; (5) white coccolite. 2. Lime-magnesia-iron pyroxene: (1) sahlite; (2) baikalite; (3) protheite; (4) funkite; (5) diallage. 3. Iron-lime pyroxene; hedenbergite. 4. Lime-magnesia-manganese pyroxene; scheererite of Michaelson. 5. Lime-iron-manganese pyroxene. 6. Lime-iron-manganese-zinc pyroxene, jeffersonite.

Aluminous: 7. Aluminous lime-magnesia pyroxene, leucaugite. 8. Aluminous lime-magnesia-iron pyroxene; (1) fassaite; (2) augite; (3) aluminous diallage. 9. Aluminous iron-lime pyroxene; (1) lindsonite; (2) polylite. Appendix, 10. Asbestos. 11. Breislakite. 12. Lavrofite.

This mineral is most extensively distributed in metamorphic rocks, which contain the lighter coloured, and also in eruptive rocks, which contain the greenish-black and black varieties. The variety characterizing serpentines and gabbros is diallage.

It consisted chiefly in such an adroit and nimble turning of the body as represented an attempt to avoid the strokes of an enemy in battle, and the motions necessary to perform it were looked upon as a kind of training for actual warfare. This dance is supposed to be described by Homer as engraved on the shield of Achilles. It was danced by boys in armour, accompanied by the lute or lyre.

Pyr·rhic (2), *a.* [See def.] Of or pertaining to Pyrrhus, king of Epirus, who invaded Italy in 274 B.C. to assist the Tarentines against the Romans. In his first battle he obtained the victory, but the number of the slain on both sides was equal, so that Pyrrhus exclaimed, "One such more victory and I am undone." Hence, a *Pyrrhic* victory, one by which the victor loses more than he gains.

Philos., Astron., &c.: The system of belief attributed to Pythagoras, born in Samos about 540 B.C., his mother being a Samian and his father, it is believed, a Phœnician. After travelling in Egypt, Persia, &c., in quest of knowledge, he settled in Croton, in the south of Italy, ultimately founding a society constituting at once a philosophical school, a religious brotherhood, and a political association of aristocratic sympathies. He died about 504. He never committed his system to writing. This was first done by Philolaus, one of his disciples. Pythagoras is said to have regarded numbers as the essence or principle of things, the elements out of which the universe was made, and attributed to them a true and independent existence. The principles of numbers were contrasted, as a straight line and a curve, an even and an odd, all traceable back to a monad in which both an even and an odd were included. The world was a breathing being. There were five elements, fire, air, water, earth, and one unnamed. In the central part of the universe was a fire, around which the sun, moon, and planets, with the celestial sphere itself, revolved. These were either themselves gods, or had their movements directed by gods. There existed a music of the spheres, the celestial bodies dancing a choral dance around the central fire. The soul of man was an emanation from the universal soul of the world. There was a transmigration of souls. Flesh and beans were not to be eaten. Nature was in uniformity with the will of the Deity, and human life should make an approach to the harmony of Nature. The Pythagorean system declined about B.C. 300, but revived two centuries later, and in the Augustan age the views of its advocates as to the past changes which the earth had undergone through the [illegible] for water A. Q.

Q, the seventeenth letter and the thirteenth consonant of the English alphabet, a consonant having only one sound, that of *k* or *c*. It is always followed by *u*, and since this combination can be represented by *kw* (or *k* when the *u* is silent), *q* is a superfluous letter. In Latin, as in English, *q* was always followed by *u*. *Q* did not occur in the Anglo-Saxon alphabet, its sound being represented by *cw* or *cu*, as *cwic* = Eng. *quick*, *cwēn* = Eng. *queen*, *cwalu* = Eng. *quail*, &c. For *qu* in English the Dutch use *kw*, the Germans *qu*, the Swedes & Danes *qv*. *Q* is most commonly found as an initial letter; it never ends a word. The name of the letter is said to be from Fr. *queue* = a tail, the form being that of an O with a tail to it.

I. *As an initial: Q* represents the Latin *Quintus* in inscriptions or literature; in geometry, &c., it represents the Latin *quod* (=which), as *Q. E. D.* = *quod erat demonstrandum* = which was to be shown or proved; *Q. E. F.* = *quod erat faciendum* = which was to be done, abbreviations frequently written at the end of a theorem or problem respectively.

II. *As a symbol:*

"The *quadrature* of the circle is a famous problem which has probably been the subject of more ridiculous confusion and research than any other problem within the whole range of mathematical science. The area of the circle being equal to a rectangle described upon the radius and half of the circumference, it follows that the *quadrature* would be possible if an algebraic expression, with a finite number of terms, could be found for the length of the circumference. Hence the problem is reduced to finding such an expression, or to finding an exact expression in algebraic terms for the ratio of the diameter to the circumference. No such expression has yet been found, and it is by no means probable that such an expression will ever be found. The problem may safely be classed with the problems for the geometrical trisection of an angle, the duplication of the cube, &c., all of which are now regarded as beyond the power of exact geometrical construction."—*Davies & Peck: Mathemat. Dictionary.*

Chem.: $C_{27}H_{18}O_{12}$. A yellow, crystallizable body, produced by the action of dilute mineral acids on quercitrin, $C_{33}H_{30}O_{17} + H_2O = C_{27}H_{18}O_{12} + C_6H_{14}O_6$. It is neutral, inodorous, melts about 251°; is slightly soluble in boiling water, easily in weak alcohol and in ether. Nitrate of silver and cupric oxide are readily reduced by it.

It crystallizes in transparent, monoclinic prisms, which are permanent in the air; melts at 235°, and is soluble in water and hot dilute alcohol. que-rī' que-rē' (**qu** as **k**), *phr.* [Heb. קְרִי (*qĕrî*) קָרֵי (*qĕrê*).]

Heb. Lit.: This expression, which is so frequently found in the margins and foot-notes of both the MSS. and printed editions of the Hebrew Bible, is either the imperative or participle passive, and signifies *read* (*lege*), or *it is read* (from קָרָא (*qara*) *to read*). It is the technical expression for the various reading which the ancient redactors of the text bid us substitute for the one which occupies or is written in the text, *i.e.*, *Kĕthîbh* (כְּתִיב). The word in the text for which there is a variant has not only the vowel-points which belong to the marginal reading, but has a small circle or asterisk placed over it, which directs to the margin (קרי) where the emendation is given. Thus, for instance, in Josh. v. 1 the text has עָבַרְנוּ which exhibits the letters of the textual reading, *i.e.*, "*we* were passed over," with the vowel-points belonging to the *queri* or *quere* = the marginal reading, עָבְרוּ, "*they* have passed over." The list of queris, which is one of the most ancient and most important constituent parts of the Massorah (q.v.), is given in *The Massorah* (ed. Ginsburg), ii. 55–93.

2. *Theol. & Church Hist.:* The doctrine that the essence of true religion consists in the withdrawal of the soul from external and finite objects, and its quiet concentration upon God. It is a form of mysticism, and has been held by individuals in the Church in all ages. In the fourteenth century it attracted notice in connection with the Hesychasts. [HESYCHAST.] The term was specially used to describe the views advocated by Miguel de Molinos, a Spanish priest, who settled in Rome in 1669 and 1670, under the patronage of Cardinal Oleschalchi, afterwards Innocent XI. In 1675 he published his *Guida spirituale* (Spiritual Guide), which was soon afterwards translated into Italian, French, Latin, and English. On August 28, 1687, the Inquisition condemned sixty-eight propositions in his writings, and on November 20 he was imprisoned for life, and died December 28, 1697. Among his followers was a Barnabite, François de la Combe, who instructed Madame Guyon. In 1694 a commission, with Bossuet, bishop of Meaux, at its head, condemned thirty errors in her writings. She was defended by Fénelon, bishop of Cambray, whose writings in turn were condemned in 1699 by Pope Innocent XII., and retracted by their author. It was believed that the Quietist doctrine tended to disparage the external observances of religion and substitute the authority of the individual for that of the Church. In another direction also, quietism in some cases tends to antinomianism. [FAMILY OF LOVE.] Cowper's versification of some of Madame Guyon's writings was first published at Newport Pagnell, in 1801, after the poet's death.

quinary-system, *s.*

Nat. Science: A system of classification published by Macleay in his *Horæ Entomologicæ* (1819-21), applied by Vigors to ornithology in 1823 (*Trans. Linn. Soc.*, xiv. 395-517), and modified by Swainson (*Nat. Hist. & Class. Anim.* (1836), 224, 225).

1. Every natural series of beings is to be traced from a given point either as a radius returning to a tendency to return, again to that point, thereby forming a circle.

2. The primary or ordinal divisions of every group are three actually or five apparently.

3. The contents of such a group are symbolical (or analogically) represented by the contents of all other circles in the animal kingdom.

4. These primary divisions of every group are characterized by definite peculiarities of form, structure and economy which, under diverse but modifications are uniform throughout the animal kingdom, and are therefore to be regarded as the primary types of nature.

5. The different ranks or degrees of circular groups exhibited in the animal kingdom are nine in number, each being involved within the other.

Fleming (*Quart. Rev.*, xli. 362-375) pointed out the fallacies of the system, and Blainville (*Manuel d'Ornithol. Introd.*) attacked it, more especially in its application to ornithology. It is now deservedly exploded.

Its mucilaginous seeds are demulcent, and given by the natives of India in diarrhœa, dysentery, sore throat, and fever. Simmonds says that in the West their mucilage imparts stiffness and glossiness to the hair, and helps to heal chapped lips. quinic-acid, *s.*

Chem.: $C_6H_7(OH)_4COOH$. Kinic acid. A monobasic acid found in cinchona bark, bilberry plant, coffee beans, and the leaves of several plants. It is obtained from cinchona by adding milk of lime to an acid decoction of the bark, evaporating the liquid portion to a syrup, submitting the calcium quinate which separates to recrystallization, and exactly decomposing a solution of the salt with oxalic acid. The acid crystallizes in colourless monoclinic prisms, which melt at 161°, and have a sp. gr. = 1·63. It exerts a left-handed action on polarised light, dissolves in 2½ parts of cold water, is slightly soluble in strong alcohol, nearly insoluble in ether. Distilled with sulphuric acid and peroxide of manganese, it yields crystals of quinone. This reaction is very delicate. The salts of quinic acid are neutral, and for the most part crystallizable; soluble in water, insoluble in strong alcohol. *Quinate of calcium*, $\begin{matrix}C_6H_7(OH)_4COO\\C_6H_7(OH)_4COO\end{matrix}Ca'' + 10H_2O$, occurs in cinchona bark, and is formed by adding calcium chloride to an alkaline quinate. It crystallizes in rhomboidal plates, easily splitting into lamine, dissolves in six parts of water at 16°, and is nearly insoluble in alcohol.

Chem.: $C_7H_{10}O_5$. Quinic anhydride. Obtained by heating quinic acid to 220°–250°. The residue is dissolved in boiling alcohol, and, when clarified, the solution is left to evaporate. It forms small crystals resembling sal-ammoniac, dissolves easily in water, has an acid reaction, and under certain conditions is reconverted into quinic acid.

quin-ī-dine, *s.* [CONCHININE.]

qui-nine', *s.* [Fr., from Sp. *quinina*, from Peruv. *quina* = Peruvian-bark.]

Chem.: $C_{20}H_{24}N_2O_2$. Chinin. Quinia. The most important alkaloid of the true cinchona barks, first obtained, but in an impure state, by Gomez of Lisbon, in 1811. [CINCHONA-BARK, CINCHONA-BASES.] It is permanent in the air, inodorous, and very bitter; almost insoluble in water, but soluble in absolute alcohol, ether, and chloroform. From its alcoholic solution it crystallizes in prisms, having the composition $C_{20}H_{24}N_2O_2+3H_2O$, and fusing at 75°. It exerts a strong lævorotary action on polarised light, and is a powerful base, neutralizing acids completely, and forming easily crystallizable salts, which are very bitter and less soluble in water than the salts of the other cinchona alkaloids. Solutions of quinine in dilute sulphuric acid exhibit a blue fluorescence, and this is observable in solutions containing much less than one part in 200,000 parts of water.

quinine-sulphates, *s. pl.*

Chem.: The neutral or common medicinal sulphate, $2C_{20}H_{24}N_2O_2{\cdot}H_2SO_4+8H_2O$, is prepared by neutralizing quinine with dilute sulphuric acid. It crystallizes in long flexible monoclinic needles, having a nacreous aspect, almost insoluble in cold water, but soluble in boiling water, in alcohol, and in dilute sulphuric acid; insoluble in ether, chloroform, and petroleum spirit. The solution of quinine sulphate in water, acidulated with sulphuric acid, exhibits a powerful blue fluorescence, and turns the plane of polarization of a ray of light strongly to the left, $(\alpha)j = 255°6$. In commerce it is frequently found mixed with cinchonidine or cinchonine. This may be due either to actual adulteration, or to an imperfect mode of preparation. The acid salt or soluble sulphate, $C_{20}H_{24}N_2O_2{\cdot}H_2SO_4 + 7H_2O$, separates from a solution of quinine in excess of sulphuric acid. It crystallizes in rectangular prisms, soluble in water and in alcohol. Quinine sulphate is largely employed as a febrifuge and tonic, and it possesses powerful antiseptic properties.
